The Pacific Coast Borax Co., 114 Sansome st., San Francisco will send a free sample of their fine borax soap to every reader of the Cultivator who may send them a writter request for some. Their advertisement will be found in the Cultivator and they will be glad to receive a request for samples. A postal card will answer if you give your name and address plainly.

ChinoRanch

Fertile Lands

$75 to $200 an Acre. Very Easy Terms.

Ninety Minutes from Los Angeles. Adjoining cities of Pomona and Ontario. Crossed by 3 transcontinental railroads. State Agricultural Station on the Ranch.

Barrels of booklets, circulars and various others forms of literature have been written concerning the merits of the various ranch properties of Southern California—but after all has been said or written the fact remains that the Chino Ranch is the strongest "productive home" proposition on the market today.

It is making a direct appeal to the scores of people now unsuccessfully farming small tracts, from lack of water, poor soil and other unfavorable conditions.

To the hundreds of small salaried people now throwing away the best working day of their lives.

To the invalid who wants a home that will earn for him a living. To all people who are seeking self-sustaining homes, surrounded by every advantage that tends to make ranch life profitable and pleasant.

Alfalfa, walnuts, sugar beets, onions, Egyptian corn and deciduous fruits are creating competences for Chino Ranchers, and the great earning capacity of Chino soil is officially recognized by the State Agricultural Department.

Southern Pacific trains leave daily for Chino at 8:05 a. m. and 5 25 p. m.

FEED THIS MUCH AT OUR RISK

THIS IS THE MONEY BACK LINE

PROVE PURINA FEEDS ON OUR NEW SELLING PLAN We have arranged a plan for the introduction of Purina Poultry Feeds throughout the Pacific Coast which will appeal to every poultry raiser who is looking for more eggs and more chickens. We take all the risk and agree to let you give our Feeds a trial *without cost to yourself.*

We have two of the largest Rolled Oat Mills on the Pacific Coast. This means that that we manufacture a large amount of Oat Shorts, Oat Middlings and Oat Groats. In each one of our Poultry Feeds we use a very large percentage of these *Oat Products* and it is on this account that we can claim more nutriment—better results—more eggs.

TRIAL OFFER

We will send (freight prepaid) four 40-pound sacks for four dollars. The assortment is as follows:

1 40-lb. Sack Purina Mash
1 40-lb. Sack Purina Scratch Feed
1 40-lb. Sack Purina Chick Feed
1 40-lb. Sack Acalfa Meal
ALL FOR FOUR DOLLARS

In each case you may feed down to the "money back line." If the feed is not satisfactory, just tie up the bag and write us. We will refund you your money and tell you what to do with the remainder at our expense.

Write us for samples and for other information.

THE MUSIC THAT CARRIES

I've toiled with the men the world has blessed,
I've toiled with the men who strove with zest,
And I've toiled with the men who wailed.
And this is the tale my soul would tell
As it drifts o'er the harbor bar—
The sounds of a sigh don't carry well,
But the lilt of a laugh sings far.

The men who were near the grumbler's side—
Oh, they heard not a word he said!
The sound of a song rang far and wide,
And they hearkened to that instead.
Its tones were sweet as the tales they tell
Of the rise of the Christmas star—
The sounds of a sigh don't carry well,
But the lilt of a laugh rings far.
—S. W. Gillman.

A SPIRITED WITNESS

Sir Henry Irving was once the guest of honor at a lawyer's banquet in New York. In the course of a graceful address he said:

"You, gentlemen, have given me the most helpful advice on the art of acting—will you permit me to give you in return a piece of advice regarding your profession?

"My advice, then, is that you make your cross-examinations less rigorous, less harsh. What is the good of treating an honest and sensitive witness in the witness stand as though he were a sneak thief?

"I confess that I am not in sympathy with harshness in cross-examinatiin, and whenever I hear of a witness turning on an overbearing lawyer my heart rejoices.

"My heart rejoiced last week. A young man in my company was a witness in a case of robbery. He had seen a thief snatch a young girl's pocketbook and moke off.

"Well, the thief's lawyer cross examined my young friend shamefully. He roared at him, shook his fist at him, raved at him.

"And at what hour did all this happen?" the lawyer, sneering, asked toward the end of his examination.

"'I think—' my friend began, but he was at once interrupted.

"'We don't care anything here about what you think!" said the lawyer with a snort of contempt.

"'Don't you want to hear what I think?' said my young friend mildly.

"'Certainly not," the lawyer roared.

"'Then I may as well step down from the box. I'm not a lawyer. I can't talk without thinking."

A RESOURCEFUL BOY

The late Peter Lorillard Ronalds liked perseverance in his servants. When he told them to do a thing, he expected them to do it, no matter how difficult it might be. If he sent a stableman out to buy a certain kind of whip, he expected him not to return until the whip was secured, tho' he have to visit a hundred shops to get it.

There is a story told about the way Mr. Ronalds came to hire a young groom.

He was in a drug store one day when a shabby little boy entered.

The boy advanced boldly to the clerk, took a small camel's hair brush from his pocket and said:

"Smell this an' gimme 10 cents' worth. I've forgotten the name."

The clerk smiled, smelt, and took down the iodine bottle; and Mr. Ronalds engaged the ingenious and resourceful lad on the spot.

TO BREAK THE MONOTONY

Chairman Shonts of the Panama Canal Commission was pointing out the necessity of amusement for the workmen on the huge canal.

"Nothing breaks the health and cows the spirit like monotony," he said. "The monotony of every workman's life must be pleasantly varied, or the poor fellow wil be unable to work well."

He smiled.

"A young lady recently took a post as governess in a rich New York family," he said. "The residence of this family was magnificent. The young lady was especially impressed by the footman who stood in the hall.

"This footman was tall and robust and shapely. He wore a glittering livery, with knee breeches and brown silk stockings, and standing in the hall opening the door, or conducting visitors to the drawing room, he was a stately and grand and solemn picture. His face was as expressionless as a statue's. He was as stiff and unbending as a lamp post.

"Well, one day, in the family's absence, the new governess heard down stairs a most hideous din—shouts, yells and shrieks, as though a couple of maniacs had broken loose and fallen to fighting.

"As she listened nervously, a maid hurried up stairs, entered her room, and said:

"'Don't be alarmed, Miss. It's only the footman. When everybody is out he always shouts and hollers so. He says he can't help it. It relieves his feelings.'"

OUR GIRLS

We are all the time talking about our boys, about what we can do for our boys, but we seldom stop to ask ourselves what we can do for our girls. Now the boy is no better than the girl, indeed, half the time he isn't her equal mentally nor morally. He doesn't bring the same influence into the home nor does he take it into society. We make him a selfish creature to start with, because we instil in his mind the idea that he is a little better than a girl, even if that girl be a sister. His mother is more to blame for this than any other person, for usually she fusses over him, gives him the best of everything and preaches to him his great importance in the world and his promising future Generally the more money in the family the more lavish are the expenditures. The girl goes along in her own way, not much is made over her nor much said about her. She isn't told how necessary she is to the universe nor how she is likely to play an important part in the social and religious matters of her time. If she isn't told in so many words that she is inferior to her brothers she is made to feel it and the thought isn't calculated to inspire her with any great amount of ambition.

Such teaching on the part of parents is a mistake. It is a grievous mistake. The sooner we get away from it the better both for the boy and the girl. The fact is, and we base the statement on experience of several years as a teacher, that girls are superior in many things to boys. They have kinder hearts, quicker perception, keener sense of propriety and are more truthful usually. They need more encouragement, because they are moulded of finer fabric. They need sympathy. Jollity and variety in life just as much as their brothers, and they want to be given to understand that they are just as much needful to the world. The moment all can impress upon our girls the fact that they are equal partners with the boys in life's great work, the sooner will they realize what they must fit them for and how they must adapt their condition to their future responsibilities. Dr. Ella S. Webb, editor of the Farmer's Wife writes some excellent things about the care of boys and girls, and some of them are so practical they really

sound as if they had been evolved by years of experience in bringing up, educating and settling in life a great many young people. Among these good suggestions we include the following:

"Don't keep girls all the time at routine tasks—everyday drudgery.

"Give them a share in the interests of the home by talking over their plans and prospects, make use of their suggestions or let them carry out their own ideas.

"Give them a room of their own and allow them to arrange it as they wish, requiring only that it be kept neat and in order.

"Welcome and entertain their friends, and make a little party for them occasionally. Send them down to do the shopping for the house now and then. They will not be properly equipped to manage homes of their own without such experience, and mistakes are better made now than then.

"Go visiting for a day or two or a week occasionally to give them the experience of running the house alone when they will learn many things they can learn in no other way than when put upon their own resources.

"Provide them in some way with a little money of their own, either a small sum in payment for some regular work, or as their share of the proceeds from the chickens, the garden or something for which they share the work and care. Young people can never learn the value of money or its proper use unless they have it to use.

"Give them every advantage possible of education, music, art, not that they may feel they have grown superior to life in the country home, but that they may the better enjoy it as their knowledge and true culture widens.

"See that they have proper outside interests—the school, the church, the young people's society and share their perplexities and pleasures, seeking and keeping their confidence, and wisely guiding them in lines of social effort for the good of others—the temperance society, the missionary society, etc."

ONE WAY TO BE ATTRACTIVE.

The housekeeper has many things on her mind, but she should not neglect giving at least ten minutes out of every twenty-four hours to her own personal attractiveness. Every boy and girls thinks "mamma" is beautiful, and why should she not be universally admired, even though not beautiful by nature, if her appearance shows she has taken care of her complexion? Every night, just before you retire, try washing the face with good soap, rinsing and drying well, then rubbing with a solution made of two parts rose water, one part glycerine and the juice of two lemons. Have enough altogether to make one pint. Put just enough on to make the face moist, and rub until the skin is rosy-red. If there are any wrinkles around your eyes or mouth, be careful you do not rub parallel with them, but straight through, crossing them. The effect will surprise you. The freckles will gradually grow dim, leaving a soft, pink-white smooth skin.—January Woman's Home Companion.

FINALLY.

Count not life's story vainly told
If but in pathways sunny
For you a lily's cup shall hold
A single drop of honey.
Atlanta Consitution.

Cookery Recipes

CORN BREAD

To 1 quart sifted cornmeal add 1 tablespoonful sugar, 1 tablespoon flour. 1 teaspoon salt and 1 teaspoon soda. Sift together stir in sour milk to make a thin batter, and bake in a quick oven.

* * *

WATER CAKE

To 1 cup water add 1 cup sugar, 1-2 cup butter, 3 cups sifted flour, 1 heaping teaspoonful baking powder. One and one half cups rich sweet cream is preferable to butter and water. Cover with favorite icing. A cheap icing is made of 1 cup granulated sugar and 1 cup skimmed milk. Boil until it hairs, remove from fire, add choice flavoring, beat till it sugars, return to fire, add a few drops of water, stir and as soon as it boils put on cake.

* * *

FRUIT CAKE

Take three quarters cup sugar, half cup lard half cup molasses, half teaspoon each of cloves, alspice, cinnamon and nutmeg, 1 teaspoon soda, 1 cup each of raisins, and currants, half cup of citron, three fourth cup up milk, 3 1-2 cups flour. Cream sugar, lard and salt together, add milk and spices, foam the soda in molasses, add to the creamed ingredients, and then stir in the flour. Roll fruit in some of the flour and mix well into batter. Bake a bit in a patty pan. If it stands the test, bake the whole quantity in a deep, square tin 1 hour. Have good heat to start with. If the test falls a bit, or seems too rich, add another half cup flour and a few drops of milk, if necessary. This is a fine cake when properly put together and well baked. Don-t forget to put a piece of paper, well greased into the bottom of the pan. Will some one please report their trial? Have good heat to start with in baking.

* * *

CITRON CAKE

One cup sugar, half cup lard(scant) 1 teaspoon salt, 1 teaspoon vanilla, 1 cup milk, 3 cups flour, 2 teaspoons baking powder,1 cup citron. Cream sugar and lard, add milk and flavoring, sift baking powder into flour, and stir all together thoroughly. Into the pan put a layer of the cake batter, then a layer of citron. Bake in an oblong tin, on the middle grate in the oven. For the frosting use 2 cups confectioner's sugar and sweet cream enough to moisten the sugar.. Color it red or green, spread on the cake, and lay on pieces of citron.

Health affects one's views of life perhaps more than circumstances, still the invalid is often bright, cheerful and hopeful. It is well to have care and forethought, but the person who is always foreboding evil becomes disagreeable to himself and to others. It is sometimes hard to look on the bright side and shut out the dark, but the optimist gains much strength and pleasure.

Women would enjoy much better health if they work more in the garden. There is something in the soil which gives added strength to the system, then open air exercise is conducive to health. Plenty of out door exercise is nature's own cure for most human ills.

"Do you love your husband?"
"Indeed, I do."
"Does he love you?"
"Devotedly."
"My goodness! It's just like a novel, isn't it?"—Cleveland Leader.

Long Lived Tools

Keen Kutter quality tells in the long life of Keen Kutter Tools as well as in better work and greater satisfaction. It is not an unusual thing for Keen Kutter Tools to be passed down from father to son, so long do they last.

The long life of Keen Kutter Tools compared with the short term of service of inferior brands makes Keen Kutter Tools by far the least expensive tools that you can buy. The

KEEN KUTTER

trademark covers every kind of tools so that you may always be sure of highest quality by insisting upon Keen Kutter Tools.

An example of the Keen Kutter excellence is found in Keen Kutter Hatchets and Handled Axes. These are made of the highest grade of steel, on the most approved lines, and by the best workmen. Every Keen Kutter Hatchet and Axe has the handle wedged with the Grellner Patent Everlasting Wedge which positively prevents the head ever flying off or working loose, and is sharpened ready for use. These are exclusive Keen Kutter features.

Some of the other kinds of Keen Kutter Tools are: Axes, Adzes, Hammers, Hatchets, Chisels, Screw Drivers, Auger Bits, Files, Planes, Draw Knives, Saws, Tool Cabinets, Scythes, Hay Knives, Grass Hooks, Brush Hooks, Corn Knives, Eye Hoes, Trowels, Pruning Shears, Tinners' Snips, Scissors, Shears, Hair Clippers, Horse Shears, Razors, etc., and Knives of all kinds.

CITRUS MARKETS

The Eastern Citrus market still holds at the same top notch scale of prices as for many weeks past, making a most phenomenal season for California growers in the way of financial returns.

NEW YORK, Feb. 27.—Fifteen cars were sold at today's auction. The market is very strong. The weather is favorable.

Local Citrus Movement

Shipments of citrus fruit from Southern California for February 25 and 26 consisted of 211 cars of oranges and 9 cars of lemons. This makes a total for the season of 9193 cars of which 1007 cars were lemons. To the same date last season 9619 cars were shipped, of which 764 cars were lemons.

A. Dodd, of Alhambra, advertises navel orange trees in this issue.

Down near the town of Corcoran there has been started an industry, which will no doubt be a success. D. W. Lewis is engaged in planting 480 acres to asparagus. The roots are shipped to Corcoran in refrigerator cars, and are planted in the same manner as potatoes, and are covered by machinery. It will be three years before Mr. Lewis will receive any returns from the crop, but it is said that the profits will be great when the returns come in. It is said that a large tract of sugar beets will also be planted in that section this season.—Hanford Sentinel.

The Pajaronian says the Codling Moth will be given a harder battle in Pajaro valley the coming season than ever before. Orchardists are determined to grow clean fruit and this be accomplished only through judicious care of orchards.

LARGE CANCER IN EACH BREAST

IN WOMAN'S BREAST, ANY LUMP IS CANCER

GREENVILLE, ORE., Feb. 26,'06. Mrs. F. June Wright, a prominent resident of this place, has just been cured of very large cancers of both breasts and armpit, with only two weeks' treatment, by the use of that most wonderful island plant remedy used by Dr. and Mrs. Dr. Chamley & Co., of 25 Third street, San Francisco, Cal. All the leading papers and scientific journals have been full of reports of their almost miraculous cures. Honesty is their policy; they treat every case personally, without knife or pain, charge nothing until cured, and offer $1000 if they fail to cure any cancer they treat before it has poisoned deep glands. They have probably the best book ever printed on cancers; sent free to those who describe their cases. It contains proof that any lump in woman's breast is cancer; also, that any tumor, lump, or sore on the lip, face, or anywhere six months is cancer. Dr. Chamley is declared by his patients to be one of the most honest and conscientious doctors they ever knew. He is the best authority in America on the cure of cancers, having cured more in thirty-three years than any other doctor living.

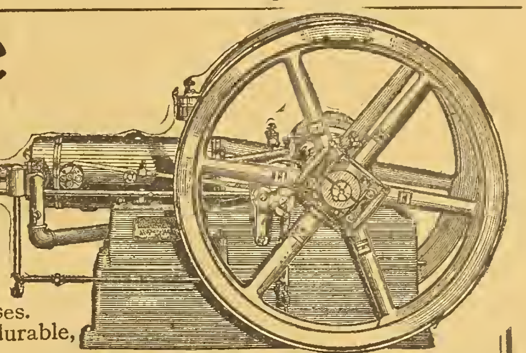
Gasoline Engines For Irrigating.



THE I. H. C. Gasoline Engines are especially adapted for irrigating purposes.

They will be found safe, durable, simple, and economical.

With maximum power, they can be operated at a minimum expense.

Expert knowledge or previous experience not required to operate them.

They can be attached to any kind of pump in any position, for raising water from deep or shallow wells, reservoirs, canals or running streams.

They excel in **full, regular and long sustained power.**

They can also be used for a general purpose engine for sawing wood, churning, cream separating, feed grinding, etc.

They are unequaled for power of all kinds.

Made in variety of sizes and styles:

Vertical—2, 3, 5 Horse Power.

Horizontal—(Portable and Stationary), **4, 6, 8, 10, 12 or 15 Horse Power.**

An engine of this description, with a suitable pump, makes agriculture a success where it would otherwise be impossible.

Call on local agent and examine these engines or write nearest general agency for illustrated catalog.

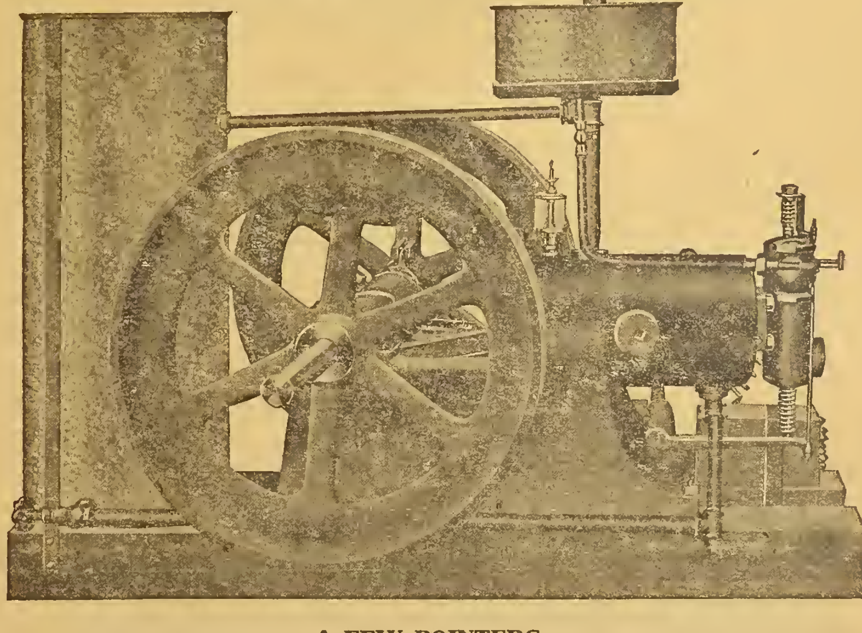
A Sure-Go Gas Engine



A FEW POINTERS

Compare it with other makes; note its strength and simplicity. No gears, few working parts, and nothing to get out of order. We can safely say we have the Acme of mechanical simplicity. We use but two valves, both vertical and of poppet type. Our governor is very sensitive and made of few parts. We furnish electric ignition, absolutely positive, of a sure kind and only makes a spark when needed. Time of ignition can be changed when engine is in motion. Gas and air mixer is extremely simple, very substantial, and has no delicate parts. It has but one valve controlling both air and gasoline. A good gas and air mixer means a saving of fuel. You get this saving in fuel when you buy a Wagaman Engine. Write for descriptive circular.

Vulcan Iron and Tool Works, 917-919 North Main St., Los Angeles, Cal.

The New Pomona Pump

We must not attribute all of the success of the Pomona Pumps to the Pump Head or the part of the machinery above the ground, for there is another part just as essential, and this is the cylinder and valves. Our cylinders are made of the best seamless brass tubing made to our order in the East. The valves are made of the best phosphor bronze and are cast and finished complete in our shop.

These valves are of the most improved pattern, have cone-shaped clappers with ground metal seats. There is only one moving part in each valve and we have never had them clogged with sand. The plungers are furnished with three cup leathers, each made from the best oil tanned leather.

With the New Pomona pumphead using a quick return motion and lap in the plungers, these valves have sufficient time to seat before taking up the load of the water column, consequently there is no hammer or jar. The Pomona Pumps are taking the lead for irrigation purposes and are rapidly displacing pumps of inferior design and workmanship.

Send for catalog and estimates for our new plants.

Drying Fruit

In California they do things on a large scale. You see flocks of poultry roaming on hundreds of hillsides as well as in the valleys, and on these hills are large poultry farms that are about a mile square, and the poultry houses are in colonies scattered throughout the fields.

The above is a bird's eye view of Mr. M. Sartori's Poultry Farm near Tomales. For the last two years the laying hens have been fed daily on Coulson's Mash Egg Food and Coulson's Chick Feed, 350 bags at a time. (About 5 wagon loads.)

Chicks, 2 Cents Each

Took from the incubator 831 chicks—fed them entirely on Coulson's Special Dry Chick Feed until 5 weeks of age—they ate 400 pounds of Chick Feed—nothing else—cost less than 2 cents per chick to feed them entirely on Coulson's Special Dry Chick Feed up to 5 weeks of age.

O. P. H., Petaluma, Cal.

Ask Your Dealer For It. Feed It One Year

M. SARTORI

After we left the seaside we drove along at a lively gait through the valleys and canyons toward Petaluma and we very much enjoyed the scenery of beautiful rugged nature, for this country is wild and mountainous. and wherever we could see in the distance around us, we could see the foothills, or what may be called young mountains. As we were driving along we noticed that on some hills there were hundreds of cattle ranging, and on other hills were large flocks of sheep; but on the majority of the hills around us, and in the distance we could see groups of little white-washed poultry houses scattered a few hundred feet apart. At each group of these little buildings there was a colony of several hundred laying hens of the White Leghorn variety, and as we drove past them, we could hear them singing about Egg Food for hens; for they all wanted it, and if some of them did not get it, it was because their owners were too selfish and too blind to all interests of their fowls to give them what they so much desired, Coulson's Improved Egg Food, that makes hens produce $4.00 worth of eggs in a year.

The above illustration represents a photographic view of M. Sartori's 700-acre Dairy and Poultry Farm, fourteen miles from Petaluma. For more than two years Mr. Sartori has been feeding his laying hens Coulson's Mash Egg Food, once a day, and any one driving along the road will be surprised to hear the noise this great flock of hens do make. All day long they are cackling and singing and laying eggs, and they are probably talking to each other about how good Coulson's Improved Mash Egg Food tasted to them, and how many eggs they were going to lay, and who could lay the biggest eggs and the most eggs that year. It's no wonder that Mr. Sartori can come to town twice a week with a whole wagon-load of eggs.

The other illustration was a view taken four miles from Petaluma, on the road to the Sartori ranch, and shows the way Mr. Sartori buys Coulson's Egg Food for the pullets and hens and Coulson's Chick Feed for the little chicks.

4 Cents a Month

Reader:—You can feed a hen Coulson's Improved Egg Food once every day for 4c a month. Can't afford that? Why, two eggs a month will pay for the feed, and when you get 15 to 20 eggs from a hen in a month, think of the money you will make by feeding Coulson's Feed.

The above picture was taken on O. P. Hall's poultry farm, showing one of the broods of young chicks then three weeks old, raised on Coulson's Special Dry Chick Feed, at a cost of 1c per chick for the first 25 days.

Mr. Hall will raise a few thousand pullets this year, to stock up his 100-acre poultry ranch. Another lot of 1500 chicks has just been hatched and the five incubators will be set several times more this season. Mr. Hall buys Coulson's Special Chick Feed in ton lots.

Coulson's Improved Egg Food Starts the Egg Machine

As seen from Middle Two Rock Road, four miles from Petaluma. By looking closely, you will notice the many small poultry houses. Each one is occupied by hundreds of chickens. The teams that you see are loads of Coulson's Egg Food and some Coulson's Special Dry Chick Feed, going to the different Poultry Farms, some of which buy a carload of Coulson's Foods at a time; for instance, M. Sartori, Geo. W. Gaston, A. D. Rezendes, W. W. Freeman and others, who have 5000 laying hens or more.

Marketing Outside of Transportation Lines

By A. N. Judd

In marketing farm and orchard products the difference in the method of presenting them to the consumer from that followed by the manufacturer is most marked.

A mighty army of agents and salesmen travel to the ends of the earth, dictating the prices of manufactured goods for the consumer to take or reject as he pleases. This work is done at the enormous annual cost of more than $20,000,000. Yet the farmer and the fruit grower with their products of the almost inconceivable yearly value of five billion dollars, have never yet dreamed of fixing the price on their products, but wait patiently for an offer that they are bound either to take or make no sale.

The year book of 1904 makes this comparison: "All the gold mines of the entire world have not produced since Columbus discovered America, a greater value of gold than the farmers of this country have produced in wealth in two years. This year's product is over six times the amount of the capital stock of all the National Banks; it is twice the sum of our exports and imports for an entire year; it is two and one-half times the gross earnings of all the railroads; it is three and one-half times the value of all minerals produced in this country, including coal, iron ore, gold, silver and quarried stone."

Notwithstanding the above showing, the farmer and fruit grower appears to think that his business is not of sufficient importance to justify his making his own markets. This is the case in the whole United States, it is even so in the Pajaro Valley in regard to the apple industry. The apple grower there, with few exceptions, turns his product over to an agent and oftentimes to an agent of an agent, who will not buy even, if the name of the grower or the name of the place grown is on the box. This results in our having received this season from eighty-five cents to a dollar fifteen per box for fancy four-tier Bellefleurs and Newton Pippins, the equal of which does not exist as regards quality.

Over two million boxes is the apple crop of the Pajaro valley this year. Think it over, fruit growers of the State. Let us, as an experiment, set aside for next year's business one cent a box of all deciduous and citrus fruits to exploit markets of the world. This would be enough to put agents at a big salary into the field at home and abroad. By so doing, we can establish, to a certain extent our own prices and secure the best and cheapest cold storage. Freight rates would also be much less, for we would do our own routing and dictate car service, do away with rebates and discriminations, thus creating transportation competition.

Extended markets cure glut and afford us a remedy for over-supply.

The nature of our products and the increased production of the same, demand constant extension of market in order to prevent commercial orcharding becoming folly.

According to the report of the United States Secretary of Agriculture, the export of apples to France in 1904 consisting of two hundred carloads, was twelve times greater than the average shipment of the previous five years.

He says that when the French become accustomed to our varieties of fruit and method of packing, their markets will become an important factor in the export apple trade. If the efforts of our representatives in France can in one year multiply the apple market twelve times, what should the grower be able to accomplish if working in his own interest?

To further accentuate the importance of co-operative action in extending our market, to say nothing of the great good, as well as profits that would accrue, I again quote from the year book, 1904, showing an "increase of apple exports from one per cent of the apple crop of 1899 and 1900 to four and three-fourths per cent of the crop 1903, 1904 equalling two millions eighteen thousand two hundred sixty-two barrels."

An investigation made by the Department of Agriculture shows that fruit intended for cold storage should be handled with the utmost care, in picking, packing and shipping and stored quickly after picking in well ventilated rooms in a temperature of thirty-one and one half degrees F.

I wish to further impress upon the grower the necessity of marketing his own products, if for no other reason than to correct the vagaries of apple buyers, and this is true of all fruits. The taste is the growers test of the quality of an apple, while the city man is influenced by the eye wholly, and in consequence, seldom eats a good apple. But as the city buyer represents our market we should try to influence him to buy by the taste, for apples and all other fruit must be consumed in greater quantities in order to sell in greater quantities.

Who but the grower should show the buyer the difference between those kings of the royal family of fruits, the Yellow Bellefleurs, the Newton Pippin and the plebeian Lauver and Ben Davis?

To show how serious this question is: At the Louisiana Purchase Exposition, apples were judged on one hundred per cent basis, and only nineteen per cent credit is given to taste, while eighty-one per cent was given to looks. In fact, all awards in all kinds of fruit, the eye awarded at least seventy-five per cent of the honors, and the taste less than twenty-five per cent.

This calls for action on the part of the grower and further illustrates the necessity of attending to at least a part of our own business.

While red apples are pretty for decorative purposes, it is the fragrance and flavor of the Yellow Bellefleur, Newton Pippin and White Winter Pearmain that tickles the palate and appeals to the nostrils, and so creates a constant demand for more of the same kind.

The Hood River grower of Oregon has shown us the way to co-operate; shall we follow his lead and go him one better or shall we accept half price for our products?

Organizing Against Plant Diseases

By Prof. R. E. Smith

We must assume at the outset a consideration of this subject only as it applies to California, since even with this limitation I can present but the briefest outline of what is being done or what might be done along the lines suggested in my subject. Plant Pathology and Economic Entomology have come to be two of the most important phases of Botany and Zoology in relation to the production of crops. Pests and troubles have multiplied with the increase in plant production, until it may almost be said that every important crop has its serious enemies. It is the means of suppression or control of these pests, diseases, and enemies which concerns the Entomologist and Plant Pathologist. Economic Entomology has far outstripped Plant Pathology in California owing to the variety and pernicious activity of insect pests in the State and the manifest nature of their injuries.

The diseases with which the Plant Pathologist is supposed to deal, include broadly all troubles with plants other than those caused by insects. These may be parasitic troubles, such as fungus or bacterial diseases, or the injurious effects produced by unfavorable conditions. Both classes are frequent, destructive, and comparatively little understood in this State. Each of our important fruits has its serious troubles, its blight, scab, rot, or "die-back;" farm crops and vegetables have their rusts, smuts, blights and mildews; our flowers and ornamentals struggle with similar enemies. Some of these diseases are well known in their nature and method of treatment, but others of the most destructive are absolutely unchecked from want of knowledge. Many of them present most obscure problems for getting at their real nature in a manner which must be both technical and practical. I intend in this paper to point out the lines along which the most practical benefit may be obtained in this direction.

In order to develop means for controlling any plant pest successfully we must have four things; Investigation, experimentation, demonstration, and application. The specialist must first investigate the nature and cause of the disease, he must then experiment along whatever lines suggest themselves, with the object of finding a remedy or method of treatment. Having found a promising method he must demonstrate that the treatment is practically successful. This being accomplished the method must be generally applied by the various growers.

In this State we have several agencies available for accomplishing these results. First of all the grower himself must watch his crops for the appearance of disease and try the application of such remedies as are suggested to him. He may also be able to experiment to some extent. The State and County Boards of Horticulture are most important agencies for the control of diseases as well as insect pests. They can aid greatly in many ways. The United States Department of Agriculture often lends its aid in various ways, giving the State the benefit of its specialists and their work. The Agricultural Experiment Station should in every state be the center of scientific investigation as applied to agriculture. The investigation of plant diseases is the province of the Plant Pathologist of the Station. He must endeavor to lay bare the whole course, nature, and cause of every serious disease; he must experiment for a remedy, and endeavor to demonstrate and apply his results, using and co-operating with all the available agencies which may aid in the work.

Without further discussion of the need of organized effort against plant diseases, or the forces available for the work, I may mention some of the undertakings now being carried on by the Department of Plant Pathology at this Experiment Station along these lines. The pear blight work is largely one of demonstration and application, the investigation having been previously done by the U. S. Department. The last legislature made nearly $10,000 available for this work, which is being done jointly by the pear growers, the State and County Boards of Horticulture, the University Experiment Station, and the United States Department. Eight men are now in the pear orchards on this work, showing and demonstrating to the growers the best methods of fighting the disease.

The lemon rot investigation represented an organized effort between the Station and the Southern California lemon growers to find a way to control a very serious decay of their fruit, which cost single growers over $10,000 last year.

The walnut blight investigation was provided for by the last legislature, and is being organized in connection with the walnut growers of the affected sections.

A beet blight investigation is in progress, promoted by the sugar beet interests. Great losses have been sustained from this source.

Various other work is in progress, but these are typical of organized, systematic work on very serious problems. It is hoped to take up other plant diseases of importance in the same manner, as circumstances and resources will allow.

Deciduous Fruit Culture

BY J. W. MILLS, POMONA, CAL.

ROOT KNOT

Root knot is a disease that some of our newly acquired fruit growers are not familiar with, and planting time is the time to begin right with it. Keep a sharp lookout for knobs on any kind of a deciduous fruit tree, or almond and walnut trees. Often there will be seen knots on the roots that are no more than an abnormal growth of healthy tissue. This may be easily identified by cutting into it with a pocket knife. If the bark on the knot and the wood under the bark are the same in texture and appearance as the normal part of the root there need be no fear that the odd looking growth will do any harm. But if the knot looks like a wart and cuts like a wilted potato, you want to burn the tree, especially the root.

There have been several theories advanced concerning the cause of this disease, but there have been no practical suggestions offered as a remedy. The only theory that we have heard that has a glimmer of hope for a relief, is that it may be a constitutional weakness in the tree that allows the knot to grow. If that is true, it may be that a variety will sometime be brought out that will be resistant to the disease. However, we doubt that. It is likely, however, that the disease may run itself out, that is, in time lose its virulence. This is not a theory; it is an idea.

Prof. J. W. Toumey, formerly of the Arizona experiment station, found that the peach was more free from the disease than almond, apricot, or plum. It is also generally supposed that trees grown on pits taken from seedling trees are less liable to have root knot than trees on roots grown from seedling pits. This point is sometimes advertised by nurserymen. We would rather have roots from seedling pits. on general principles, but would not expect them to be more free from root knot than any other roots.

A few years ago, we had occasion to need 100 seedling trees and secured sprouted pits from a local nurseryman. He obtained the pits from some old seedling trees that were growing in an old Spanish settlement near Pomona. The nurseryman kept his seedbed in the usual way and picked over the pits as they sprouted and planted them. We did not get our pits till late and they were among the last to sprout. The nurseryman had practically no root knot on his trees, and ours, which were planted in soil where no tree had ever been planted before, had 80 per cent afflicted with root knot. This would seem to show that trees grown from pits with the most vitality were least liable to have the disease, and that trees having been grown on stock from seedling pits is no guarantee that they are more hardy from a root-knot standpoint than trees grown from pits from budded trees. This fact was further emphasized not long since when a grower near Pomona brought us some young apricot trees that had grown but one year in the orchard. They were budded on stock raised from seedling pits and had made a magnificent growth. They were as healthy a lot of trees as we ever had seen, except that they had from ten to fifteen knots each on the main roots. There were places on the roots which showed that injury had been done to them before planting and had healed, but there were no indications of root knot ever having been present at those points but there were a dozen knots on other portions of the root system. The knots had started some months after the trees had been planted. We have never seen a knot (gall knot under discussion) growing where or near where a root had been cut off at planting time.

* * *

MALAGA GRAPES

We have just received a marked copy of the Brawley News with the request that we answer it. The marked paragraph is as follows: "I have observed in the California Cultivator in the question box where an Imperialist has been asking whether Malaga grape is a good grape for this country, that he would put out 80 acres of them. An answer in the Cultivator warned this man not to do it as it was very expensive".

We regret that the gentleman did not get the idea as we presented it. The man who asked us the question was in grave doubt as to the advisability of planting 80 acres all to Malagas. We advised him not to unless some local demonstration warranted such an enterprise, warning him that one or two seasons do not prove to a certainty that a certain crop is always going to be the best or will always pay. We take this view from our own experience in farming. We also took the pains to investigate the question of growing certain varieties of grapes in the Colorado desert region. We had heard of the immense profits derived from two-year-old vines. The vines had surely made a phenomenal growth and they had produced a crop that was equally astonishing in size. We also found that the following year was not a favorable one, and, it being very hot, a number of the vines had died, and but a very small crop had matured and that was quite inferior in quality. Last summer was a favorable season for grapes in the desert regions and good reports are given. But the industry is young and we do not believe that the grape question is at all settled as yet. There are experimental plots in which a large number of varieties of grapes are being tested. These tests may be made in a small way by the farmer, but we will repeat that it is expensive for the farmer to experiment on a large scale. We hope that the Malaga will prove one of the banner grapes in the Imperial valley as we have friends there who are putting money in improvements and are counting on this prage.

* * *

SPRAYING GRAPE VINES

It will be found profitable for grape growers in sections where mildew has been, to spray with bluestone water just before the buds swell. Make the solution one pound of bluestone to ten gallons of water. Wet the entire plant with this, also the ground beneath and for a distance of a foot around the trunk of the vine. This will destroy all the mildew spores that have collected in the bark and near the surface close to the vines. By following it up with sulphur as soon as the blossoms have dropped and again when the grapes are about the size of sweetpea seed, there will be very little, if any, mildew.

The great difficulty in preventing mildew from getting a start in the coast valleys is due to the moist and cloudy weather that sometimes prevails just when the fungus is starting. Sulphur acts only when the weather is warm enough to volatilize part of it. The bluestone puts a quietus on the greater part of the disease seeds and if the weather is too cool to make sulphur work right, it does not make so much difference.

* * *

OCHRUS PEAS

Editor Cultivator.—Can you tell me where I can get the Ochrus pea for seed? I have been searching for it among the seedmen and others and they know nothing of it. Please give me what information you can about the seed and its summer and winter uses, and confer an appreciated favor.
A. E. N., Burbank.

We do not know where you can get any seed of the Ochrus pea and doubt if the seed can be had in quantity. You may find out perhaps, by writing to Prof. A. V. Stubenrauch, at Riverside.

The plant makes a good spring growth, but very little during the winter months. Two years ago at Riverside, it produced 33 tons of green stuff per acre. The Tangier pea growing beside it produced 46 tons per acre. Two varieties of vetch averaged 24 tons and Fenugreek produced 14 tons per acre. Peas produced about 25 tons.

Orange county is preparing to make the most of the city and county scheme in Los Angeles whenever it is worked out. An active campaign is being carried on in the territory contiguous to Orange county in favor of annexation to that county whenever the breakup comes.

We sell country lands. CHATFIELD & VINZENT, 228 Montgomery St., San Francisco, Cal.

Plant Loganberries

For profit. We are prepared to purchase the fruit and, in fact, all kinds of small fruits, even if too ripe for other uses. If you have

Practical Farm Science

BY PROF. A. J. COOK

FEED THE BEES

The pregnant and timely rains which surely give promise of more to follow, may make us reasonably hopeful of a good honey year, so far as the needed rain supply goes. No bee keeper should fail to see that his bees are all in condition to reap to the fullest from the prospective harvest. Although the rains of a year ago were generous and ample, the season was not a good one for bees or honey. Cold damp weather and trying winds either forbade the secretion of nectar by the flowers or else held the bees to the hives, so that in many sections the harvest was most disappointing. If for this reason or if so much honey was taken from the bees, that their stores are depleted, then they must be fed. Without a question the greatest loss suffered by California bee keepers comes from failure to supply the bees with the needed food to prevent starvation. The frequent years of no honey not only robs the hives of the needed food, but also makes the bee keeper incautious or neglectful. Yet with the good seasons comes such a flood of honey that no bee keeper can afford to neglect this attention, and when necessary the proper feeding. Often a dollar thus spent will save a colony, and very likely secure a harvest of from ten to twenty dollars the following year. We may also remember with great profit that the sugar factories sell a cheaper sugar that is perfectly safe and wholesome for the bees. This should be secured surely when any considerable feeding is to be done.

* * *

THE CODLING MOTH

We are now buying apples here in Berlin, that come from Canada and the United States. We pay from one and one-half to five cents each for them. It is quite common for the dealer to sort this fruit, putting the defective in one box and the sound in another. He then sells the better fruit for from one to five cents more a pound. I find that in most cases the codling moth has caused this loss often almost wholly. As long as we now have so good a remedy against this pest should we not all use it and not produce and market "wormy fruit?" This is the time when the apple grower should see to it that his apples are free from this defect. Let us all remember that good arsenites applied as soon as the blossoms fall from the trees, one pound to 200 gallons of water, with four or five pounds of freshly slaked lime added, and applied so thoroughly that every apple is treated will do very much to give us sound fruit. A second application three weeks later will make the remedy more complete; while some orchardists think it wise to apply three and even four times. Every apple grower should send to the University at Berkeley for the Bulletin on spraying, and keep it ever in sight, that he may not only fence against the codling moth, but also against the blights and scab as well.

* * *

THE CLUBS

I am glad that the Editor calls attention to the value of club work for farm, garden and orchard. There is no one thing that will begin to pay as well as a thoroughly alive farmers' club, which embraces in its membership all the community. In some of the states these clubs have attained a marvelous growth and influence, only because the people appreciate their value and neglect almost anything else before they slight them. This insures the best work on the farm, the best up-to-date methods the best social relations, and all needed attention in way of securing proper legislation. In some States these clubs have been fairly revolutionary in their work and influence.

At these clubs the social feature is kept to the fore front. At each meeting a full meal is served. This is provided by the host of the day, which as there are often nearly or quite 100 present, is no mean task. Yet it comes only once in one or two years, so one can afford even this big effort, and all enjoy it most thoroughly.

Inspection of the farm where the meeting is held, and a very rich program aid greatly to enhance the value and influence of the club. In these clubs they discuss everything except religion. Even political views are well threshed out, and all enjoy it. In some of these clubs the organization owns the dishes, the lapboards and the folding chairs. These are housed and cared for by the one where the meeting is held, until a day or two before the next meeting, when the one who is to entertain the club goes for them. These clubs have been flourishing for years, and have done wonders to advance the agricultural interests in the respective neighborhoods. I wonder if this "love feast" each month, where there is so much of good fellowship and kindly sympathy has not had great influence in keeping the club interest at white heat? One big meal for the community a year is not too much, if it tends to unite all in good fellowship, and to promote the best good of the community. Indeed they have studied this matter of refreshment, and do it so scientific a way that the labor and expense are minimized. Although the meals are superb, yet more than one good house wife has said they do not mind the labor or expense. Every one in the club takes part on the programs, and they develop a power little expected in very many. . At tables, they generally sit in long double rows, and each four or six holds a lap board in the lap, which serves as a table. Everything shows thought and is done decently and in order.

I knew a man some years ago, who spent not a little money in making a half mile model road in front of his farm, and then put up close beside a full description of how it was made, cost, etc., etc. Of course this object lesson was most effective and soon there were miles of such road in the neighborhood. I wish some one—some enterprising community in California—would try this club plan as described above. May be they would become as great philanthropists as was this road builder.

Consul Hamm, of Hull, writes that letters received by him suggest that a trade in honey might be built up between that city and the United States. Considerable honey is produced in Yorkshire, but not enough to supply the market, especially at the present time, as the product this year is way below the average. There are small direct imports made, and more comes by the way of London and Liverpool. The ruling price of California honey in Hull at the present time is about as follows: Wholesale, $6.80 to $10 per 112 pounds; retail, 16 to 36 cents per pound; free on board, $3.80 to $9.75 per 112 pounds. It should not be understood that there is an extraordinary demand for honey in this neighborhood, but a limited amount of a good article rightly placed might find market.

COW PEAS draw nitrogen from the air in large amounts, if sufficient POTASH and phosphoric acid are supplied to the plant.

The multitude of purposes served by the remarkable cow pea, are told in the 65-page illustrated book, "The Cow Pea," which also tells of the splendid results obtained from fertilizing cow peas with POTASH. The book is free to farmers for the asking.

IMPORTATIONS OF NURSERY STOCK

It would seem that our California nurseries should produce stock enough to supply the home demand, but it seems that they are unable to do so, and every year sees the importation of eastern and Oregon grown stock increasing. This season the importations of nursery stock from the outside have been the heaviest ever known, peaches, plums, and apples being the principal varieties, peaches leading by long odds. For the past three or four years the local nurseries have been unable to supply the demand for peach stock. This is to be regretted, as we are sending money away that should be kept at home, and this is the smallest objection. It is almost impossible to trace the locality in which much of this eastern stock is grown, and there is always great danger of introducing serious diseases with it. In many parts of the east peach yellows, rosette and little peaches are prevalent, any one of which is as serious among peaches as is the Anaheim disease among grapevines or the blight among pears. The introduction of any one of these diseases might prove fatal to one of our greatest fruit industries. There are also many pernicious insects in the East which we do not want in California and which there is danger of introducing with this stock, even with the greatest care. It is to be hoped that our California nurserymen will get to work and propagate enough peach stock to supply the local demand.

WALNUT GROWING IN THE NORTH

The walnut has made wonderful strides in popular favor as an orchard tree in the northern counties of this State and also in Oregon and Washington. More inquiries are now being made about this fruit than any other one, and especially from Oregon and Wahsington. Sonoma County has gone very extensively into walnuts during the past two years, and as the soil and climate there are especially favorable for their growth there is little question but that they will yet be one of the most profitable crops of that section. Mendocino County also is paying a great deal of attention to the walnut and an awakened interest is being taken in it in Siskiyou where along the Klamath River, there is a very large body of land suitable to it. The quickest way to get an orchard which will give returns is to secure stock from the nurseries. Trees any where from two to four years old may be set out. They should be removed from the nursery with as little damage to their roots as possible, but before planting all damaged roots should be removed. A hole sufficiently large to accommodate the roots without crowding should be prepared, and the trees be set at not less than fifty feet apart. Crops may be grown between the trees until they come into bearing, so that the land will not lie idle until they yield a crop. The better plan for setting out an orchard although much slower, is to set several California walnuts in each place where a tree is desired, let them grow during the first year and then remove all but the strongest one. This should be left until it is three or four years old and then grafted to any variety of the English, or rather Persian walnut which may be desired. By this method good, stocky, healthy trees will be secured which will bear fruit long after their planters have passed away. The process is a very much slower one than the first, as crops will not probably be got until the trees are from eight to twelve years old. The first method is the more in favor, as in California we do not usually plant for posterity.

A NEW HORTICULTURAL COMMISSION

San Benito county is the last in line in the appointment of a county Horticultural commission, the supervisors at their last session having appointed Wm. Palmtag, W. W. Canfield and F. L. Barnhisel as such commission. Nothing has more forcibly impressed upon the northern counties the necessity for an organization of this kind than the rapid spread of the pear blight. It matters not how well the work of instruction in fighting this pest may be given, nor how strongly the necessity for the work may be impressed upon the greater part of growers. there is no other means of enforcing the work except through the county commissioners, who have the legal power to compel recalcitrant owners of orchards to keep them in order. All the growers in a county except one might do the necessary work to eradicate the diseases, and all their labor go for naught so long as that one refused to clean up and persisted in leaving his trees as a breeding place for the diseases. In this way one obstreperous individual could ruin the industry of a whole community. but this one can be handled by the County Commissioners. This fact is so well appreciated that several of the upper counties which have refused to appoint commissioners before are now coming into line.

TREES

We have been swamped with orders far beyond our most sanguine expectations. We still have hundreds of orders for shipment. The season is now rapidly advancing, and in order to make a clean up of certain lines of stock, we are prepared to offer inducements worthy of your attention. The stock mentioned below is all in the very best condition and can be planted any time in March with absolute safety.

Apples

The following Standard Sorts:
Arkansas Black
Baldwin
Ben Davis
Bismarck
Gano
Northern Spy
Red Astrachan
Red Pearmain
Red Bellflower
Smith's Cider
White Winter Pearmain
Gravenstein
Jonathan
Lawver
Missouri Pippin
Rhode Island Greening

Pears

Beaurre Clairgeau
Beaurre Giffard

Peach

Elberta, 6000 trees in June buds, on which special inducements will be offered. Also the following varieties in June buds: Heath, Levy's Late. McKevitt (the finest White Cling known), Phillips, Tuseen.

In Yearling Trees—Foster, McDevitt's Cling, Nichol's Orange Cling, Tuscan Cling.

Plum

Our supply is limited, but we still have a surplus of the following sorts. Place your orders at once for immediate shipment.
Burbank
Columbia
Duane's Purple
Grand Duke
Peach Plum
Shropshire Damson
Yellow Egg

Prunes

We predict that in two years from now prune trees will be in bigger demand than peaches were this year. The stock which we have to offer is exceptionally fine, and if you contemplate planting, now is the time to get in your orders, for we are in the position to make you prices which will surprise you. We have a very heavy stock of French Prunes on Almonds, Peach and Myrobolan; we also have a surplus of Hungarian, Inperial, Epineuse, Robe de Sargent and sugar. Don't delay, but let us figure with you if you are in the market for any of this stock.

Figs

You already knew that we are leaders and the only firm offering the Calimyrna Fig tree. Our sales this year have been heavier than ever, but we still have some trees in surplus, however, and it will pay you to correspond, with us. Remember, none are genuine without our seal.

Grapes

Our shipments of grapes are extending all over the world, but with our immense stock it is only natural that we should have some sorts on hand still. Grapes can be planted for a full month yet. In varieties grafted on Phylloxera Resistant roots we have the following:
Alicante Bouschet
Black Malvoise
Cabernet Sauvignon
Feher Zagos
Grenache
Mataro
Moselle Riesling
Muscat
Pedro Ximenes
Petit Bouschet
Petit Syrah
Rose of Peru
Sabal Kanski
Trousseau

On their own roots:
Alicante Bouschet
Black Cornichon
Black Ferrara
Black Malvoise
Burger
Cabernet Sauvignon
Carignan
Charbono
Feher Zagos
Folle Blanche
Grey Reisling
Grenache
Gros Colman
Mission
Mondeuse
Palomino Blanco
Pedro Ximenes
Petit Bouschet
Rose of Peru
Sabal Kanski
Thompson Seedless
Trousseau
White Sweetwater
Zinfandel

Send Your Orders In Now and Get the Benefit of Reduced Prices

We still have a magnificent assortment of deciduous trees, including Texas Umbrellas, Poplars, Oriental Sycamores, Maples, etc.

We are also prepared to fill orders for Green House Plants. Roses. Palms. Evergreen Trees and Shrubs. All this stock is grown under our personal supervision. Write now for anything you want for the orchard or garden, and give us an opportunity to figure with you.

Our large Catalogue, profusely illustrated, published in English or Spanish, will be mailed to any address on receipt of 5c to cover postage. Price list mailed on application.

With the Citrus Growers

BY J. W. MILLS

PRUNING ORANGE TREES

It is commonly stated that dead wood in an orange tree is injurious and is liable to cause disease. It is our opinion that such statements are not the result of careful thought, but are made on general principles. We never were sure that dead wood in an orange tree became a source of disease. It very often is the case that disease causes dead wood. Dead wood as commonly developed in the tree is the result of overgrowing, simply the shading of the slower growing and weaker branches. These small branches and twigs leave no scars, but if left alone will gradually decay and be broken off by natural causes. They sometimes do serious damage to inside fruit by scratching it. This is one of the reasons why it should be removed but there is a better one why it should not be allowed to form at all.

When the small inside branches become weak and partially dead, they have passed their usefulness and should be removed before they die. At this stage they are shutting out more sunlight than they are after they shed their leaves and are dead. It is before they die that they do the greatest harm. If they are removed faithfully every year, the task will be a light one and a higher percentage of fancy fruit will be the result. All growers know that the highest percentage of the best grades of oranges comes from the shady side of the tree. It therefore stands to reason that the more oranges a tree can keep in the shade, the more fine fruit it will produce. If the useless branches —those which have gradually declined —are removed an increased amount of light is permitted to enter the tree, the inner twigs and branches will keep up their work for a while longer and when they too reach the enfeebled stage where they are useless, thy should be removed. This process will increase the bearing capacity of the tree by filling the interior of the tree with fruit which is the best fruit. Now this is not a theory. It has been practiced by one of the most successful oranger growers in Southern California. We have watched his pruners at work in the orchard of Valencias and under this treatment (and perhaps a few other pats on the back) the trees produce enormous crops every year. The pruners find very little wood that is entirely dead, it nearly all has a few leaves on it and of the amount taken from a tree that produces 10 or 12 packed boxes, the trimmings would hardly fill a picking sack, but it is done every year and the pruners follow directly after the last pickers. It is our candid opinion that if the orange growers generally in Southern California would follow this practice, the standard of her oranges would be raised to a considerable degree. It would be expensive to get the trees right, but after that the task is a light one.

This practice of pruning young trees, especially Valencias, has not met with much favor. It is not a popular fad, but some of the most successful and careful growers advocate it and practice it too. The cutting seems quite severe and consists in removing the long rampant growth that takes the lead. This is not cut off as a stub, but the cut is made to branches and the smaller branch takes up the lead or main growth. When the tree comes into bearing it is able to bear up the heaviest crop without propping for all time.

DIE-BACK ON CITRUS TREES.

Any kind of a case where the twigs die off is usually called "die-back," but the real thing is quite distinct. The spring growth seems to be perfectly normal and all indications point to a permanent and healthy growth. About the first of June the foliage begins to die on the young growth and the young stems themselves will die and curl. The base of this growth will sometimes survive and send out another set of buds which will not mature the leaves and so continue through the season till the buds form rosettes. This is accompanied by an exudation of brown gum on the older wood.

The disease works alike on lemon and orange trees and is not very common in California. There is no discernable difference in the character in any degree, of the soil for a depth of three or four feet, where the trees are diseased and where they are perfectly healthy and full sized. Some of the worse cases that have come under our observation, are within forty feet of trees that show no trace of the disease. In such cases, the roots of the sick and well trees have part of their roots intermingling.

The fruit on the affected trees is apt to have chocolate brown spots and the rind is usually thick and rather brittle. The flavor of these oranges is usually good but the quantity is always very small because the spring growth keeps dying back. The trees cannot attain even a fair size for the same reason.

Experiments have been made with sprays containing fungicides, and heavy doses of stable manure, commercial fertilizers and nitrate of soda have given no relief. Tile has been laid through affected areas with the hope that the aeriation of the soil would have a beneficial effect that could be detected. The trees do gain a little each year but it is so slow that they are a dead loss as far as profit goes. Trees were budded over in hopes that they might take a new start. This, too, proved unsatisfactory. This is one of the problems that is lying in wait for our Pathological Station.

NEW USE FOR CITRON.

We were told the other day by a Riverside man, that preserves made with the citron of commerce was a most delicious addition to their lists of desserts. It has a flavor different from preserved lemon or orange and retains some of the genuine citron flavor.

THE GOVERNMENT WHITEWASH

Very frequently we are asked for a good recipe for making whitewash. Below we again give the formula used by the government in making whitewash, which will be found very good for poultry houses, fences and outbuildings generally.

Take half a bushel of unslaked lime, slack it with boiling water, cover during the process to keep in steam, strain the liquid through a fine sieve or strainer and add to it a peck of salt previously dissolved in warm water, three pounds of ground rice boiled to a thin paste and stirred in while hot, half a pound of powdered Spanish whiting and one pound clean glue previously dissolved by soaking in cold water and then hanging over a slow fire in a small pot hung within a larger one filled with water. Add five gallons hot water to the mixture, stir well and let it stand a few days, covered from dirt. It should be applied hot, for which purpose it can be kept in a kettle or a portable furnace. Coloring matter may be added as desired. For cream color add yellow ochre; pearl or lead, add lamp or ivory black; fawn, add proportionately four pounds of umber to one pound Indian red and one pound common lampblack; common stone color, add proportionately four pounds raw umber to two pounds lampblack. For interior work: Slake a peck of lime till it is thick and creamy. While it is hot mix with a pint of linseed oil and one-quarter pound of glue previously dissolved in water. Let the mixture stand several hours before applying it. A little lampblack dissolved in vinegar and mixed with whitewash gives a grayish tint, which may be preferable to pure white, a little umber gives fawn color and yellow ochre a cream tint. Very little coloring matter should be used, or the shade will be too dark.

If this is made somewhat thinner than indicated above and strained through a flannel cloth it may rapidly be applied with a sprayer such as is used in spraying trees. When strained through cotton cloth the lint from the cotton often interferes with the work.

"MARBLES," NOT "NAVELS"

In the article on the hardy orange, by Dr. C. K. J. Jones, published in this department last week he wrote that said hardy oranges ranged in size from "marbles to tangerines." The intelligent linotype operator made it read "navels to tangerines."

The Ornamental Garden

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

FORCING PLANTS

Some curious and successful experiments are now being made in Europe with ether, the object being to ascertain whether it can be used to advantage for the purpose of forcing hothouse or other plants. The ordinary course is to wait until the first frost has stripped the leaves from the plants, thus permitting them to take for a season that repose which all living creatures need. If vegetation could be arrested and repose begun sc[illegible], it is evident that the plants [illegible] blossom much earlier next season. [illegible] this is precisely what the ex[illegible]s with ether are designed to accomplish.

WATER GARDENS

As the beauty of a painting is enhanced by a fine setting, so should our water garden have a background of tropical and subtropical trees and plants. How great an advantage do we possess over those who live in colder latitudes, when we can use for this purpose, planting permanently. the feathery papyrus, giant grasses. large-leaved caladiums, musas, the towering bamboo, and a great variety of noble and beautiful palms.

CULTURE OF THE CHRYSANTHEMUM

The world-wide popularity of the chrysanthemum, and its prominence among cultivated flowers, is excuse enough for anyone to wax eloquent; nevertheless, we shall be as brief as possible and confine ourselves to the production of the giant flower.

It is now rapidly nearing the planting season, which is from March 15 to the last of July. For outside culture, March, April and May are looked upon by the writer as the most favorable time to plant in California. Intensive culture alone will bring about the lovely giant-flowered beauties so much admired by all lovers of the Autumn Queen. It is my purpose to show that there are no secrets about it, and that it is a simple and easy matter, after all has been said, to have the largest and finest blooms in one's own garden.

The chrysanthemum is a gross feeder, and needs plenty of moisture. Preferably, the soil should be made moderately rich at planting time, with well rotted stable manure, but should not receive any more enrichment, unless the plants show the need of it, until the buds form, when liquid manure, or chemical fertilizers of some kind, should be applied while the ground is still damp from irrigation. When the buds begin to show color, all fertilization should cease and only a moderate amount of water be given them. The fact that the petals will "burn" if the soil is too rich at blooming time, is the reason why liquid fertilizers should be given instead of any more lasting manure, at budding time. The chrysanthemum rapidly consumes all fertilizers given in a liquid form, which leaves the soil in perfect condition at blooming time.

If one is desirous of obtaining the largest flowers, the plant should be limited to not more than five or six shoots, each to produce but the one terminal flower. It is better that the plant be made to branch low by nipping out the top. When it has reached six or seven inches in height, the required number of shoots may be allowed to grow until they have reached eight or ten inches in height, when, if the plant is desired to grow less tall than would otherwise be the case they in turn may be nipped off at the ends, and one shoot from each, be allowed to continue on to bloom later. All side shoots, together with the suckers from the roots of the plants, should be rubbed off as soon as they appear, leaving only such as are desired to bloom. Only one bud should be allowed to remain on every stem, and that the most promising one.

A good liquid manure may be made from fresh horse dung and water left to soak several days. About one-half bushel of manure to a barrel of water. Nitrate of potash or nitrate of soda may be used at the rate of one ounce of the chemical to ten gallons of water. Fertilizers of this nature should be used cautiously, for the plant will utilize it immediately. It should be watered with it once a week until the buds begin to show color. At this stage of growth, the more varied the liquids used the better the result, and for that reason we advise to alternate liquid stable manure with the chemicals.

I have said nothing about cultivation because it is second in importance to fertilization. It is better to cultivate after liquids have been applied so that the next application will have a better chance to permeate the soil.

If a great show of color is desired, it is only necessary to pinch back the plant several times, and allow from fifteen to twenty shoots to grow and bloom, when the flowers will be probably one-third smaller. The plants will, however, remain in bloom several weeks longer, and yet produce flowers four to six inches broad.

There is no other flower which will repay good care, in a more liberal and gracious manner, than the chrysanthemum, and none which will bloom so freely, and look so altogether lovely as the Autumn Queen.

Let us give it a place in our garden, that it may gladden our hearts when nearly all other flowers have ceased to grow and bloom for us. Wm. W. Marugg., North Pomona.

CELEBRATING ARBOR DAY.

In many of the cities in the upper part of the state Arbor Day is growing in popularity and this year has been more generally celebrated than usual, the ladies being the prime movers in the matter, as they have taken hold of the work of city and village improvement with commendable energy. The idea is a most excellent one, as it cultivates a taste for the the beautiful in nature, especially among the young folks who are always active coadjutors in the work. There is no better or more grateful form of ornamentation for a town than well grown ornamental and shade trees along the streets. and in this direction is the work of Arbor Day directed. But too often the work ends with the planting, and those who have taken part think their labors ended when the young trees are set out. This is wrong. When the trees have been planted the work has only commenced. They have then to be carefully attended to and cultivated until they have acquired sufficient age to care for themselves. Every town should have its town or village improvement club, one of the duties of which should be to see to it that the shade trees of the town are properly cared for. In such a case there would be some encouragement for the people to turn out on Arbor Day and plant trees with the assurance that after planting they would be taken care of until they were old enough to reward, with their beauty and their shade, the efforts of those who planted them and of those who care for them. Arbor Day is much to be commended, but let it be well followed up.

"You women folks must be wearin' a sight of birds on your hats this season," ventured Uncle Abner, as he carefully removed his coat.

"Why, Abner?" asked Aunt Sophronia.

"Well, they wuz a feller sot in front of me on the train that was dressed like a dandy—fur-lined coat, a diamond big as a shell bark hickory nut, and a plug hat; and I heard him tell the feller settin' with him thet he'd made over $10,000 this year skinnin' jays."—New York Times.

In the Vegetable Garden

BY ERNEST BRAUNTON

THE VEGETABLE GARDEN

The pleasure and economic importance of vegetable growing is but slightly appreciated in many sections of California, and as a consequence, it is given but careless and ignorant attention. It is no difficult matter to curtail the table expenses one-fourth by giving a garden of an acre, or less the care and attention it deserves. Favored as the State is in soil and climate conditions, fresh vegetables of a great variety should daily be gathered from a well kept garden throughout the entire year.

"LEGGY" TOMATOES

Plants which have grown tall and spindling are known among gardners as "leggy" plants, in distinction to those which are "stocky," or short and stout. Leggy plants usually give very poor results in the field when set in the ordinary manner; but some growers obtain good returns from them by laying the stem upon the ground or in a little trench, when setting, and covering it with earth, allowing only a few inches of the tip to protrude. This treatment prevents the breaking of the plant by the wind, and roots will form along the buried portion which aids in the production of a crop of fruit, but "leggy" plants seldom yield a crop like that from stocky, upright plants.

VITALITY OF BURIED SEEDS

The Bureau of Plant Industry has for years carried on extensive experiments to test the vitality of seeds buried at varying depths and periods of time and the results carefully noted.

From these results it is pointed out that many weeds can be destroyed by deep plowing and leaving the soil undisturbed for some time; that the seeds of cultivated plants lose their vitality, while the seeds of weeds retain their power to grow remarkably well when buried; and that the vitality of all seeds is best preserved by careful harvesting and storing in a dry and comparatively cool place. The results further indicated that the deeper seeds are buried the better the vitality is preserved; that hard seeds of the same species retain their vitality much better than those with softer seed coats; and that unhulled seed, especially of the grasses, retains its power of growth better than hulled seed.

AGRICULTURE WITHOUT IRRIGATION

In a bulletin issued by the Bureau of Plant Industry, entitled "Agriculture Without Irrigation in the Sahara Desert," the country known as the Oued Souf, situated in extreme southeastern Algeria, is described and its population, climate, water supply, soils, and date gardens are discussed.

The discussion on the date gardens includes descriptions of the methods of planting, care of the palms, and the harvesting of the crop. The manuring of the soil, the removal of the drifted sand from the gardens, the yields secured, and the varieties of dates chiefly grown are also considered. It is pointed out that in the Oued Souf, renowned for the large yields of its date orchards and the high quality of their fruit, the type of agriculture practiced is not dry farming, as it depends upon the ground water, which in the gardens is everywhere near the surface of the soil.

It is further stated that the sand hills of the region concentrate and reflect so much heat that the hollows among them act as forcing houses in producing early dates. While the same conditions with respect to ground water may not be found anywhere in the United States, it is believed that the growing of dates in the hollows between the sand hills may be applicable to the hot regions of the Southwest, where large sand dunes exist, and where water for irrigation is available. "It seems certain that in pockets of this character excavated among the dunes the Deglet Noor and other valuable varieties of dates could be forced to early maturity."

PRUNING TOMATOES

In a late Massachusetts bulletin is given a summary of the results secured at the different experiment stations in this country with tomatoes as regards soils and fertilizers, transplanting ,pollination, time required to grow crop, yield per square foot, pruning, etc., with the details of experiments by the author on pruning tomatoes. Most of these experiments were conducted in greenhouses.

In one experiment, when a few of the lower leaves were removed from plants trained to a single stem. there was a gain of 32 per cent in stem growth and 18 per cent increase in the size of the fruits over unpruned plants. In three other experiments extending over 1, 2, and 3 months respectively, with plants trained to two stems, the removal of the lower half dozen or more leaves gradually decreases with time.

When the leaders were not cut back the smallest number of fruits per plant was obtained on the plants trained to a single stem. These fruits were of good size and the plants thus trained produced the earliest fruit of all the different methods of training. The yield also on equal amounts of trellis space was the greatest by this system of training.

"The greatest average weight of individual fruit, as well as the greatest weight per plant, however, was given by the 3-stem system where the leader was headed in, whereas in the average number of fruit per plant this system is lowest. There was only one experiment in which heading in was practiced. In general, however, these experiments show that if we wish to obtain large fruit with a tolerably good number per plant the single leader constitutes one of the best systems, with the 2, 3, and 4-shoot systems following in tolerably uniform succession. No doubt the largest fruit and the greatest acceleration in maturity can be obtained by heading in the leader."

BRANDYWINE STRAWBERRY PLANTS

FOR SALE

30.000 Extra Fine Kellogg Strain Brandywine Strawberry Plants that were reserved for party who now orders them sold.

E. E. LEECH, IRWINDALE, CAL.

A Big Seed Offer

Convincing Seed Buyers of the Quality of : : :

Taylor's Seeds

Try Seeds First, Then Send Money

In order to introduce our seeds as rapidly as possible we will, upon request, send one each of our specially arranged collections of choice vegetable and flower seeds. The quantities are proportioned and selected to give a continuous supply of flowers and vegetables of high quality throughout the season to those who do not care to wade through long catalog lists. So certain are we that they will give satisfaction, that we will send our collection of flowers, 14 varieties, and our vegetable list, 14 sorts, for $1.00, and wait for our pay until you have tested the seeds and proven to your own satisfaction that they will germinate and produce the results we claim. If they are not first-class you do not send us a cent, if they "make good" June 1, send the dollar.

You know we could not do business on such liberal terms if our seeds were not as represented. They are guaranteed true to name and the seed grown. Remember, we require no money in advance. Order today, using coupon below, and you will say it was one of the most profitable dollars you ever spent.

F. Gilman Taylor Seed Co.,
Box 27, Glendale, Cal.

Please send me prepaid one each of your vegetable flower collection. If they grow satisfactorily, I will pay you $1.00 on June 1st, 1906. If not satisfactory, it is understood that I am to be at no expense whatever.

IT PAYS TO FEED MANGELS TO YOUR STOCK

The stockman will find that a good mangel constitutes a cheap, healthful ration for stock, keeping them free from disease and rendering the digestion so perfect that they get the good of all they eat.

THE LILLY'S BEST ROYAL RED

Is the most productive red stock beet we have ever grown. The Royal Red is beautiful in color—firm and succulent, and will produce from 1,500 to 2,000 pounds per acre.

WASHINGTON GOLDEN GIANT

Grows to enormous size, half of its bulk out of ground making it easy to pull, is a splendid tonic and digestive for stock. The flesh of the Giant is white and sweet. Never any wasted. The Giant produces a larger crop than any other mangel. It is a great milk and meat former. Sheep, Cattle and Hogs are ravenous for it, and it puts them in excellent shape.

A prominent stockman says about the Golden Giant: "I feed about as much grain and hay with the Giant as I did without, but I put cattle on the market in three-fourths the usual time."

Send for free copy of Lilly's Crop Book. It is full of information valuable to the Pacific Coast farmer. It tells how to grow things "out west."

Try these two mangels. You will find that your cows give more milk when eating mangels in their rations and that cattle are ready for market in about three-fourths the usual time.

Both of these Mangel Seeds sold only in sealed pkgs.	Package . 10c Half Pound, 25c One Pound, 50c PREPAID

By express or freight, at expense of buyer, 10 lbs. **$2.50**

The Pure Food Bill—The whole country will give Congress the glad hand for the passage of one of the most wise bills which has ever been before that body. It has been stubbornly fought, but it has triumphed. Next to the Rate Bill, the Pure Food Bill is of most vital importance to farmers. Why? Because they cannot stand for the adulterations which are made in the cereals compounded into adulterations. It lessens the value of their selling commodities. Then ,too, if by adulteration of foods, sickness results, the farmer feels the effect more seriously than any other class of our citizens. He is farther removed from the physician and it costs more for medical attendance on his family. The bill ought to pass. The welfare of the country demands it. It will eventually reach the President, however, and that official will attach his signature to it with satisfaction for he is advocating it.

Last year the records show the death of over 1500 persons poisoned from eating adulterated foods, and this week a subscriber sends the Cultivator a formidable list of persons killed and injured in one month by eating adulterated foods as compiled by a current magazine. The list of the dead includes four persons who died from eating toadstools mixed with mushrooms, three poisoned by candy, three by wood alcohol contained in lemon extract, and many by the same subtsance in whiskey; four infected by typhoid fever germs contained in ice cream. twin babies poisoned by formaldehyde used to preserve milk, and hundreds of persons poisoned by beer manufactured from glucose, in the manufacture of which sulphuric acid made from an arsenic bearing mineral has been used. Many of these cases were reported by health officers and food commissioners of the various states in which they occurred.

The importance of the measure is such that it would justify a combined effort on the part of the country to force the bill to an early determination.

* * *

Business Conditions—Barring the internal troubles in China, which may be exaggerated for political effect, of course we cannot judge of that there is no doubt in the business and commercial sky of the world. The railroads of this country have placed the largest orders for equipment and extensions that were ever known. Bank clearings are remarkably large, indicating an unprecedented volume of business. The increase for the west in bank clearings is most marked, the end of February showing a most healthy condition and vital activity in all our avenues of trade.

The crops of the country at large promise a maximum revenue to the grower. Live stock and live stock products are moving in large volumes to market and are met with trong export demands. California fruits were never in such demand nor have they been more satisfactory to growers. All in all, the evidence at hand is promising of continued and assured prosperity for the people who produce as well as for those who invest. The reorganization of life insurance companies may be taken as a most healthful symptom—an evidence of the strength and capacity of our people to right a great wrong without panic. Of course, we are speaking in the broad sense of business conditions, in Southern California there is only one thing to create possible uneasiness and that is the recent decision of the Supreme Court on the Orange Rate case. But growers are not hurt, at present. and if the transportation lines will conduct their business, as they say they intend to, giving fair treatment to shippers of California fruits, we shall witness the most prosperous year in 1906 the State has ever passed.

* * *

The Owens River—Work is to be begun at once on the Owens river project and the expectation is that the great conduit will be built to the point where it is to pierce the mountains this year—a distance of 60 miles. There cannot be too great heat exercised in pushing forward this proposition. It ought to be completed and water flowing from the river to Southern California points within four years. The rate at which the population of the territory south of the Tehachepi. is increasing, the country being opened to agricultural and horticultural advancement, renders the necessity for abundant water imperative. Besides this, the cities and towns are growing so fast that the present supply of water for domestic purposes is not more than equal to the demand.

With the problem of water settled, what is left to make Southern California the Mecca of the world in point of fruit, flower and vegetable culture? Of course as a farming and dairy proposition, Central and Northern California will always hold the place, for the water is abundant and the climate specially encouraging to stock and dairy production. But while this is not true of Southern California, yet it is true that with abundant water these interests will enlarge to much greater proportions than is now the case. We shall be satisfied all of us, when the Owens river comes down to greet us for a new kingdom will be born when the King comes.

* * *

To Appeal to Congress—The orange growers of Southern California have united in an appeal to members of Congress to amend the provisions of the existing rate law to overcome the decision recently rendered by the Supreme Court. Representatives from every locality in Southern California interested, have been sent to Los Angeles to confer with the Fruit Exchanges and to memorialize the President and Congress to amend the law so as to give the citrus growers some living chance against possible railroad rate usury. The growers do not seem to credit the statement sent out by certain freight agents that the transportation companies will not avail themselves of the power given in the Supreme Court decree, and create a new tariff. They think possibly no action will me taken while Congress is in session, but as soon as it adjourns the railroads may raise the rate and arbitrarily route shipments to suit themselves. It is to head-off such conditions that the present action is taken.

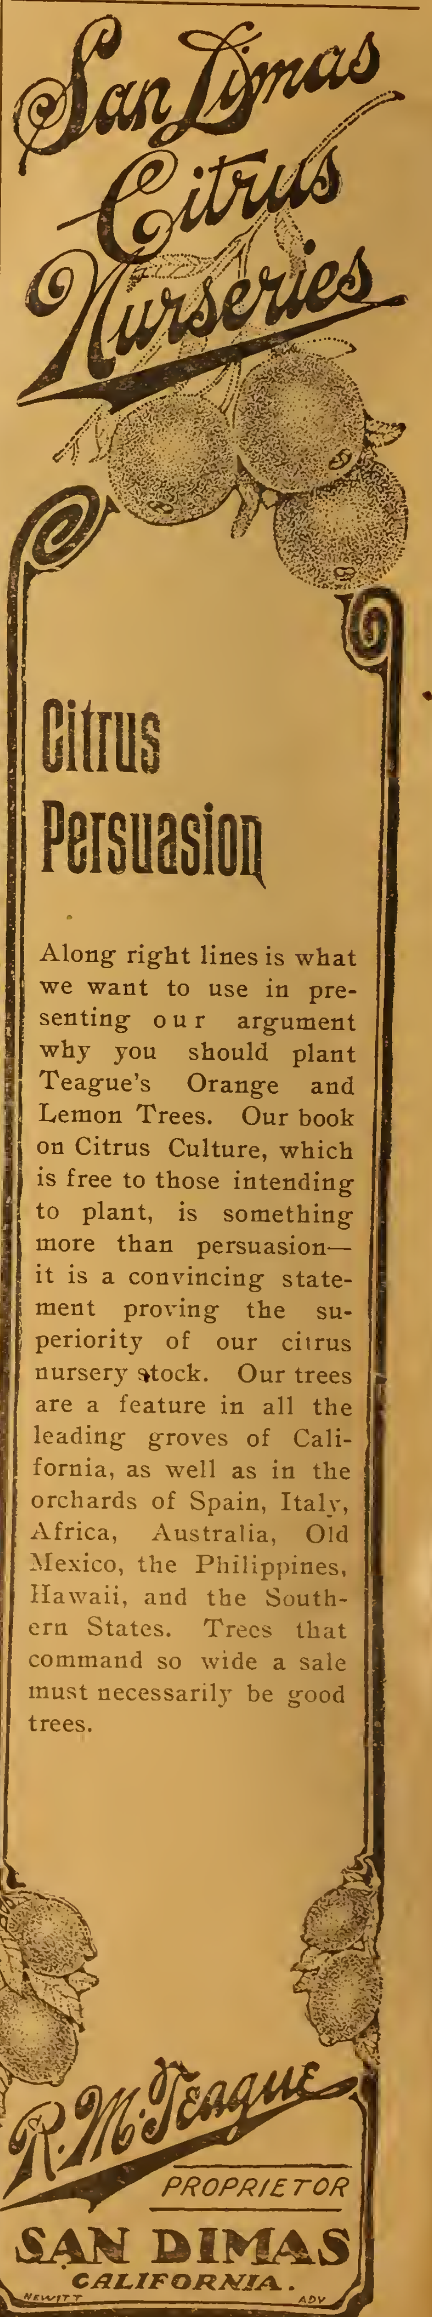
As was said by the Cultivator last week, the railroads are anxious for business, and the fruit business of California is a great big thing to them. They will not likely proceed to kill their own prospects by injuring other people, no matter how bitter they may feel toward them. Hence as the orange and lemon trade is a paying one now, why should the present arrangement be disturbed by the transportation lines? It does not seem probable that it will be, but nevertheless, "a stitch in time" is a good thing to take, and the citrus growers will have done all they can to avert a calamity if they attend to the subject of amending the present law, decided by the Supreme Court, and putting it out of the power of the railroads to work an injury to them if they ever take the notion to do so.

* * *

The Dominion Short-Horn and Holstein breeders held their annual sessions at Toronto on the 6th. The former received during the year $11,380 for registration fees, $5,076 membership dues, and $100 interest. W. G. Pettit was chosen president. The Minister of Agriculture addressed the society, counseling them to consider "whether we shall retain the beef ideal or vary for a breed that shall include the dairying industry as well."

The Holstein society has taken in 59 new members during the year and registered 1636 animals, both these figures being notably larger than those of 1904. Mr. F. S. Spencer, Assistant Live Stock Commissioner, presented what is known as "the government's plan" that the various associations shall have a record of merit, and a fixed standard by taking tests and ascertaining what the good cows are capable of, which plan was rejected by the meeting. R. S. Stevenson was chosen president; G. W. Clemons, St. George, secretary.—Country Gentleman.

The annual meeting of the Jersey Breeders Association of Southern California will be held at Santa Ana, Tuesday, March 13th. An interesting program has been arranged for the meeting. The electon of officers will take place in the forenoon, and discussion of matters interesting to Jersey Breeders will occupy the afternoon session.



San Dimas Citrus Nurseries

Citrus Persuasion

Along right lines is what we want to use in presenting our argument why you should plant Teague's Orange and Lemon Trees. Our book on Citrus Culture, which is free to those intending to plant, is something more than persuasion—it is a convincing statement proving the superiority of our citrus nursery stock. Our trees are a feature in all the leading groves of California, as well as in the orchards of Spain, Italy, Africa, Australia, Old Mexico, the Philippines, Hawaii, and the Southern States. Trees that command so wide a sale must necessarily be good trees.

R. M. Teague
PROPRIETOR
SAN DIMAS
CALIFORNIA.
NEWITT ADV

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

California now produces about 6,000 carloads of apples per annum.

A wonderful interest has been developed in Mendocino county in the planting of vineyards, and according to the papers from Ukiah, over four hundred acres are being set out.

R. Malan four weeks ago set out some strawberry plants. Today they have berries as large as a marble, which will be ripe within ten days. —Bayley News of this week.

L. T. Orr, the Occidental wine man has shipped 75,000 gallons of wine from his winery at Grafton, as the Green Valley station is now called. Another big shipment will move in March.—Sonoma County Farmer.

The horticultural inspectors of Sacramento county have been instructed to serve notice on all pear growers who have neglected to take proper steps against the pear blight and proceed to have the work done.

The local authorities of San Bernardino have requested that a quarantine be placed upon the empty orange and lemon boxes that are returned to them from the north. They fear that these boxes may become impregnated with the Purple scale.

The Hanford Sentinel says that John P. Schalk shipped [illegible] 000 Muscat grape cuttings to Corcoran last week, which is part of a shipment of 200,000 that he will send down there. That number of cuttings will set about 400 acres and if the enterprise succeeds there will be a chance to get an addition to an association when the next one is promoted.

Prof. Newton Pierce, government pathologist, accompanied by a committee composed of Supervisors Smith, Holderman and Fulsom, has arranged to plant some fine trees and shrubs in the Orange county park at Orange. Prof. Pierce has offered to present the park with 175 different species from all over the world, if the county will care for them.

The Chase Nursery Company of Pasadena gives several hundred rosebushes to the schools of Riverside county. The same gift was made last year, and proved an incentive for the improvement of numerous school grounds in several districts of the county. They have also made a similar gift to the school gardens of Los Angeles City.

The Pomona Times is authority for the statement that R. M. Teague has just sent a number of choice specimens of citrus to Algeria by way of exchange with the director of extensive botanic gardens in that state. For buds of varieties grown by himself, Mr. Teague will receive a large number of some of the rarest specimens known on the shores of the Mediterranean.

The oranges at Redlands began dropping, that is, in one grove, and the trees to shed their leaves. Commissioner Peace made an investigation which disclosed the fact that a gas pipe running along the street fronting the orchard had sprung a leak, and the gas was gradually percolating through the soil, proving poisonous to the citrus trees. The fact that quite a large area was affected is explained to be due to the gas being blown by the wind through the orchard after escaping from the soil.

AGRICULTURE.

Orchardists are planting English walnuts in large acreage in Sonoma county.

It is reported that from 600 to 800 acres of cantaloupes will be planted in the Exeter and Lindsay district this year.

In the Placentia and Orangethorpe districts there are 560 acres of cabbage. The output will consist of about 600 carloads.

The Coachella Submarine says: "The asparagus crops are just coming forward; it takes three years for them to come into bearing.

The Gardeners' Association of Pasadena has announced a list of several handsome cups and trophies to be competed for in the coming flower show to be held April 5, 6, and 7.

Orange county has sown more barley this year than ever before. The demand for feed is growing with the population of the country and Orange county is a king on barley production.

The sowing of alfalfa has been going on steadily, says the Vacaville Reporter, and there will undoubtedly be between 150 and 200 acres sown to alfalfa this spring in that vicinity, this being a conservative estimate.

Two hundred and fifty tons is the amount of the county's peanut crop for the year, according to the statement of C. E. Utt, known as "the goober king." Three hundred acres produced the whole crop, of which eighty tons were raised by Mr. Utt on one patch of 100 acres.

Orange County bean growers on the San Joaquin ranch will put in more than 7,000 acres this year. Originally but 100 acres was planted as an experiment, now there are over 7,000 acres so used. On this ranch beans produce there from 10 to 15 sacks to the acre, so that the yield may be expected to be about 90,000 sacks.

The ten thousand mark has been passed in beet acreage for the Chino factory this year. To be more exact 10,010 acres were contracted for up to last Wednesday, and probably 200 or 300 acres are yet to come. This is a record acreage and promises the biggest sugar campaign for 1906 that the Chino factory has ever had.—Champion.

The Imperial Standard tells us that Theodore White of Calexico has alfalfa that stands over two feet and hasn't bloomed yet. He has nearly ten thousand cabbages that will soon be ready for the market. While raising grain and alfalfa Mr. White does not overlook the little things. He sold over forty dollars worth of radishes and young onions in Calexico during the month of February.

A small bug is working havoc in the early peas in Alameda county. It is taking the entire crop. thus far it has been confined to certain sections but it is feared by horticulturists that it will spread throughout the country. It attacks the buds and ruins them before they have a chance to develop. It is feared fruit is also in danger from the pest.

The shortage of the celery crop is a disappointment to growers. In the Santa Ana district G. W. Moore, president of the celery association estimates that there are only about 150 cars of green top celery left. To prevent a repetition of this shortage in February it has been planned to plant next season at least 1,000 acres to Green Top, a late and hardy variety. This will insure a good supply for the latter part of the season when Golden Heart is exhausted.

MISCELLANEOUS.

A new weekly paper called the Palo Alto Tribune is to appear in March in that town.

Palo Alto is all astir over the question of cutting down live oak trees that stand in the streets.

About 1300 legal divorces were granted in California during the six months ending January 1, 1906.

The Carnegie Institute has appropriated $315,000 to build and equip an observatory on Mt. Wilson near Pasadena.

Lent is a fast of forty days, not including Sundays. It began March 2, Ash Wednesday and ends with the Saturday preceding Easter.

The cornerstone of the new $15,000 City Hall at Sonoma was laid with appropriate ceremonies by the officers of the Grand Masonic Lodge of California on the 24th.

The solution of the water problem at Riverside has been helped by the purchase of the San Bernardino Valley Traction Company, by the Riverside Trust Company.

A movement is being made at Covina for the organization of a new mill and feed company, to be known as the Pioneer Mill and Feed Company, with a capital stock of $20,000.

It would appear that the affairs of the California Development Company are to be thoroughly aired in court. Injunctions, a Receiver and sundry other conditions are asked by the stockholders.

The Los Angeles Chamber of Commerce has appointed Congressman McLachlan and R. Woodland Gates to represent it at the National Reform convention to be held in Washington March 13.

A Covina grower writing to Los Angeles Times say that: "The way the people of Los Angeles have been fed on the refuse of the packing-houses each season by the peddlers is a shame and a disgrace which ought to be suppressed.

The Oakland Enquirer says the Southern Pacific and the Gould lines are planning to build into San Diego, which fact, says the Enquirer, will make of San Diego the principal seaport city of Southern California.

It is reported that the Southern Pacific is planning to greatly extend the development of its holdings in the Kern River field. The report is to the effect that sixteen new derricks are to be erected at once and the new wells rushd. This is one of the greatest oil fields in California.

LIVE STOCK.

There is no place on the globe where horses can be raised cheaper or quicker. than in the Imperial Valley. —Standard.

The [illegible] of Corning reported this week the shipment from that station of 8,000 pounds or four tons of dressed turkeys, 40 dozen chickens, and 1350 dozen eggs. Great poultry country is Corning.

The Monterey Fish and Game Association have taken action to stop the Japanese fishermen from denuding the bay shore of shell fish. The game laws are to be strictly enforced hereafter.

Some of the dairymen around Palo Alto are proposing to inaugurate a campaign to rid the city of sellers of milk from individual cows claiming private owners of unhealthy cows are distributing germs of tuberculosis from cows affected with the disease.

Thomas Turnbull of San Francisco has purchased a farm at Antelope and has begun the work of farming with characteristic energy. In 1899 Mr. Turnbull was selected by the State Board of Trade to represent the State of California before the Congressional Industrial Commission of Agriculture and Agricultural Labor.

A report from Profs. M. E. Jaffa and A. R. Ward of the University of California upon the milk supply investigation conducted by them while acting as special inspectors has been filed. The most important part of the report is that devoted to the subject of tuberculosis in cows. The tuberculin test is, in the opinion of the experts, one which should be regularly applied to all milk coming into this city as they hold that the disease can be communicated from milk of an infected cow to the human subject.

Live Stock and the Dairy

BY MRS. MINNA E. SHERMAN, FRESNO, CAL.

MORE FEEDING.

In raising the herd standard the usual way is to use a sire better than the cow he serves, one that has a good dam and a good great dam. This will raise the amount of butter fat in the quickest way, when supplimented with heavy feeding to increase the milk yield. Even if they are selected scrubs feed them all they will pay for, and if they do not bring in a reasonable profit as dairy animals, they will sell to the butcher as beef, if fat, though I would not take up the business of fattening cattle in the dairy. Here is where the monthly test has its greatest value in preventing waste. These common cows have no race inheritance that is known; they are simply the individual cow so there is no race characteristic to judge by.

When a herd has been in the same hands for a time the eye grows skillful in seeing the sire and dam in the heifers I can tell in the pure-bred heifers at once if the Aggie blood is in the ascendant or if it is the Mechthilde or De Kol, and from the strain can predict if the heifer will be a heavy milker or a rich one and if she has stamina, then if she has all three, she is a record breaker—but only time can prove the strength and amount of butter-fat. In the monthly test the cows that are paying handsomely for their feed are encouraged by yet more liberal feeding and given all the grain mixture they will clean up, there is where nice feeding judgment comes in; to give freely, yet not to overdo it.

* * *

The few cows in a well culled out herd that go to beef are turned out as soon as possible, here is where a large ranch has advantage over smaller places in that this beef is consumed at home, and saves enough in the difference between the prices paid and the prices charged by the butcher to pay for the food consumed, and then one knows that it is healthy meat. I have had cows among the natives that did not respond at all to grain feeding and did well on grass, these cows fell off in milk when winter came and had to be discharged, so again the Babcock test saved money.

The half bred heifers will come into milking in two and a half years after starting with common stock. These are tested monthly from the first calf. Many of them will make as much butter as heifers as their mature mothers are making. This first good blood will stamp an identity on the calves so that they will run more uniform in habits of feeding than their dams. The education now needed is to fix the milking period. It is well to hold back the breeding of these heifers for a time so that they will not freshen again for a year. Then push them with feed and milk them even if they only give a small quantity up to within eight weeks of the time they freshen, then dry off and cut the grain out entirely. I have often had heifers milked that only yielded a quart toward the last, this of course, did not pay, but the next time the heifer freshened the difference between her and the neighbor's cows was marked.

* * *

The old advice of breeding the heifers back to their own sire is wrong, and will only result in loss, I tried it, when absolutely ignorant of stock raising, on the advice of a great dairy authority. I was foolish because I should have thought that Moses knew the laws of life as well as the moral laws, and followed him as a greater authority. The heifers bred in this way on the ranch simply faded away before reaching their fourth calf; it was a severe lesson for there was a bunch of over forty.

The next sire of the same breed that followed the first sire should be more strongly typical of his breed, or finer, for the physical side has been pushed away with the first cross of the improved strain, and now the mental, if this term can be used, the mental meaning, the acquired inheritance comes into play. Succulent food is needed in quantity, corn silage, soiling crops, beets, pumpkins or even alfalfa hay swelled by wetting over night. With grain enough to supply the required nutriment and the milk made, for without both succulency and enough dry food to make up the amount that the animal put into the milk, the development cannot be complete. This is proceeding along the old lines of development laid down by Darwin's law of heredity, and it has been followed by all the great breeders of live stock. This plan has developed all we have in the great breeds of cattle. It has also developed the two minute horse and thirty pounds of butter cow. Yet there comes Mr. Burbank to say that environment is the strongest force. I feel now like trying the experiment if without good blood it be possible to make great cows, by feeding scrubs. I do not believe it would, though a long period of selection, when environment would become inheritance. I know that there are native cows that have been selected and handled that give surprising results, yet they will not transmit it and the whole process is too slow and expensive to throw away cattle as Mr. Burbank does, a hundred thousand seedlings to preserve one. It would be beginning a new race of cattle, for in the second or third generation environment has become heredity and in many generations it has become habit, and at last it is recognized as the type.

* * *

In making the first test of the heifers it arouses interest among the men to ask them to choose the first, second and third best and then the poorest milker in the bunch. Sometimes they grow so interested that they they bet on it. When I used the old twelve-bottle test that turned with a hand crank, I never lacked for recruits to "make her spin." Rarely has the first heifer chosen as best been the best, that is a matter of surprise. The best heifer, however, has always been among the first five, and the poorest has rarely failed to have been picked out, so there is after all, a little danger of a man selling off his best cow unknowingly, as is so often stated in dairy literature. Indeed, rather, it is the tendency of every man to overrate his cows production, or else why would they keep cows that do not pay at all? It is not surprising after all that the men do not come any nearer than they do, as the minute quantity of fat that makes a pound or two of butter in a week is not noticeable in the increased richness of a pailful of milk. To the untrained eye yellow milk is the richest. While this color is desirable it has nothing really to do with the butter fat globules, and often white milk may be richer when tested by the Babcock test.

Cows show considerable variation during the year, and among the native cows I have owned that have long records, one especially is deserving of note. This cow we called Pet. In 1894 she made 200 pounds of butter. In 1895 she made 275 pounds of butter. Her best effort in 1897 was 301 pounds; in 1898, she made 344 pounds; in 1900, 396 pounds; in 1901, 368 pounds; in 1903, 345 pounds; in 1904, 193 pounds, in 1905 231 pounds.

At the end of this year the cow died. She had had her fifth calf when the record began: so that when she died she was of full age.

When this cow was first purchased she was very thin, just come from the hills, she was very wild at first but became gentle, as her name indicates, and was a pet of all the milkers. This shows the effect of good feeding on even an old scrub cow. It is said by the friends of the scrub cow that she is immune from tuberculosis, yet if the reports that come to us from the inspectors of meats in San Francisco are reliable, the sons of the scrubs are even more tuberculous than the dairy cows. The disease has in late years, no doubt, increased in range cattle, since the ranch cattle have become more and more of dairy animals, and their offspring have been sent to the hills. There is a constant traffic in very young calves, the milkman wishes to get rid of them and the butcher pays only a trifle, so the women in the hills load up the wagons with them and raise them by hand. It is their chance to get a little herd of cattle for themselves at almost no cost.

The risks of infection with this disease in a dairy herd comes within itself, and no sire should be used, except from a tested herd, or a herd where the calf is raised on milk separated at home for the mixed skim milk from a creamery is a menace to the health of the herd.

In breeding for butter fat the work is away from nature. As nature has little use for extra fat in raising young animals, she tends toward making them muscular, and with solid lean tissue, as in the race horse, under the pressure of high feeding the animal weakens, and after a time ceases to breed freely, as the stamina drops and it requires a wise man to see that the herd is not bred out of existence.

Cows like change of food and change of surroundings, I think ours do better if they have an outing, so the dry cows are sent in bunches to the other ranches and seem to be much better for the change. How happy they seem as they lay on the banks of Fancher Creek, under the shade of the big cottonwoods, chewing their cuds, with eyes full of dreams as they watch the rapid water dimply as it rushes by. I often wonder what is in their thoughts, apparently so full of peace are their contenances.

FOMENTING THE UDDER

Editor Cultivator.—I have a heifer that has a sore bag just on hind teat. It is swollen hard. I used belladonna sweet oil and camphor, and yet it does not seem to help it. C. J. L.

The remedy used is a good one, but usually people fail in the application of remedies to the udder and teats of the cow. The teat should be fomented with flannel rung out of hot water, for twenty minutes, changing as quickly as it cools, twice a day, timing with a watch, while the teat is soft draw off the milk with a milking tube, then apply the sweet oil and belladonna. If the weather is cool the udder should be protected with a bag made of blanketing. We often cure these troubles with one thorough steaming. The cow is brought to the engine house, and a heavy blanket pinned over her so as to enclose the udder, one of the milkers sits down beside her and takes the steam hose and also the udder against his hand and the steam is turned on. The man feels it all the time so it is not too hot. An hour's steam usually takes out all inflamation in a recent case and the cow does not drop in her milk at all and is relieved of pain at once.

TO DRY THE COW

Editor Cultivator.—Will you kindly inform me through your paper as to the best way to dry up a cow just before calving and how long should she be dry, and after calving when is milk fit to use. A. S. Pasadena.

At ten weeks before calving notice for two milkings how much milk the cow is giving, then leave half a pint or less at each milking in the udder.

What You Gain
In a few words, you gain this by using a Tubular: (1). One-quarter to one-half more cream, because Tubulars skim by centrifugal force, which is thousands of times stronger than the force of gravity that makes cream rise in pans. (2). One-half to twice as much for butter, because Tubulars remove dirt and bacteria, thus making gilt-edge butter possible. (3). Half the work saved, because you finish skimming five minutes after milking, feed warm skimmed milk at barn, and have only the can of cream to care for. Write today for catalog W 260 It tells all plainly.

Stop feeding grain or bran, and if the grass is very good turn her out for only half the time and give her hay the rest of the time. When the milk flow is well reduced milk once a day and then only every day until the flow ceases. An ordinary milk cow should be dry six or eight weeks, The milk is merchantable at the fifth to ninth day according to the city ordinances. The ninth milking is usually considered as right on farms.

SEED CORN.

Editor Cultivator: I am thinking of building a silo and was quite enlightened on the subject of "Ensilage as a Dairy Feed," by your paper to the "Cultivator" I would like to know where to obtain seed corn of the "Early Yellow Rose or Mortgage Lifter variety in quantity to plant fifteen or twenty acres.—G. P. A., Colusa.

The Mortgage Lifter corn and Yellow Rose are not in the market now, as the corn plant has been greatly improved since 1896. At present we are using the King Phillip, but have six varieties to try this coming summer and will report on them when the crop is harvested.

FEEDING SILAGE TO BULLS.

With the exception of green pasture grasses, silage stands pre-eminent as a food for bulls. Like other foods, it has its disadvantages, but its advantages are so great that the former are offset. For female stock, roots may take the place of silage and are oftentimes more efficient; but in the case of bulls, many breeders have found through sad experience that roots are very injurious to the male organs of the beast. Oftentimes silage contains such an abundance of corn grains to be too fattening in its nature for the breeding bull. In this case a smaller amount, supplemented with clover hay or some other food rich in protein should be fed. Immediately after a large feed of silage (like immediately after watering) the bull may be slow at service, but this can be no more than a minor objection.

The chief advantage to be gained in feeding silage to bulls comes through the succulence of the food. There is always an extreme contrast noticeable between silage-fed bulls and those receiving no succulent food. The bull that is fed silage presents a slick appearance; his hair is soft and silky, and his hide mellow and soft to the touch On the other hand, the bull fed otherwise wears a harsh coat of long hair over a stiff hide through the winter months. Now, when it is remembered that the hide and hair of a beast are an index to the condition of the inner organs of the body, there is considerable evidence that the digestive tract of the silage-fed bull must necessarily be in better working order. This renders the bull more healthful throughout, and the fresh sappy appearance results.

Oftentimes bulls are deprived of exercise. In this case silage proves even more advantageous. Two young herd bulls in charge of the writer have received very little food this winter except about 30 pounds of silage and ten pounds of clover hay per day. and their development has been wonderful. They have remained in excellent condition and are proving satisfactory in the breeding pen. In fitting bulls for show purposes the paunch seems to be greatly distended and all indications of feeding capacity are greatly improved by the liberal use of silage.

Bull calves are very fond of silage also, and all calves in my charge are now receiving all of this succulent food they will eat with relish—and such develonement of barrels and such a growthy sappy appearance as these youngsters present is difficult to imagine. One precaution we shall exercise this year in planting corn for silage, is that it shall be planted thick enough so the greatest amount of forage with the least amount of grain shall be produced. The grain shall be raised elsewhere, ground and added as the condition and requirements of the animal shall direct the judgment of the feeder. This will also prove advantageous in feeding the cows.—Hugh G. Van Pelt, in Jersey Bulletin.

THE HOG

The American hog has a virulent enemy in the editor of a paper at Big Springs, Tex., who proceeds to roast the great mortgage-lifter in the following caustic fashion: "The hog is the dadblamedest, split-hoofed long-snouted, bushy-bodied animal we ever saw. He can make a fellow madder than other animals that infest the premises. He will always squeal and muddy your pants when he knows you are trying to feed him. He will get into your garden through a knothole and destroy enough produce in three minutes to feed your wife and children for three months. He will pay no attention to a wide-open gate where you want him to go through, but will shovel out several cubic yards of dirt to make a hole into a place you don't want him to go. He is the biggest nuisance and most profitable on the farm. You will never know the trouble and pleasure of life until you raise hogs. They are a bother and a vexation to the spirit of man man while they live, but bring joy and contentment to the soul of man when they die at hog-killing time."

PIGS ON ALFALFA.

How many young pigs can thrive on a four acre piece of land, beginning 1st of March, and what shall I have to feed them to make them grow (not necessarily fat) until I have feed last of August.—H. N. A.

If you have alfalfa twenty pigs can be fed on four acres and keep them growing. The old rule was a gain of 1000 pounds to the acre for a season, and pork at 5 cents is supposed to net the grower $50 per acre for his alfalfa.

Of course shoats will need a little grain toward the end of the season to harden them, for alfalfa-fed hogs are extremely soft.

AMERICAN FENCE TALKS
By the Makers

There are many fences on the market. Some tell of their wonderfully hard wire; others speak of new form of construction that make all other forms look ancient and worthless. But through all this it remains a fact that more miles of American fence are in use than of all others combined, and will continue so.

American fence is for sale by the dealer in your town. You can find it there, examine the different styles and make a selection to suit your requirements. Or, write us direct and we will send you a catalogue and tell you where you can get the fence.

Malthoid Roofing
is delivered in solid rolls containing 216 square feet of roofing and the nails, cement, tin caps and directions for laying.

A ready-to-lay roofing

With the exception of a hammer, MALTHOID is all ready to lay. The process is so simple, any one can do it after once reading directions. It is much easier than laying a carpet and not nearly as troublesome or as tiresome as laying shingles.

Malthoid Roofing is made from a compound that will not dry out--a compound that is almost indestructible. This roofing is good enough for the highest class buildings, and low priced enough for barns, sheds, shacks, miners' cabins, etc.

Malthoid does not require a coating of paint—it is finished when laid and will last many, many years, resisting fire, overcoming the ravages of the elements and serving as a thoroughly water and weather-proof roofing.

Malthoid is inexpensive—a large roof surface can be covered quickly—it does not warp, shrink, crack, blister, flake off, run or deteriorate in any way.

Profit in the Poultry Yard

BY MRS. A. BASLEY, HOLLYWOOD, CAL.

NEGLECT CAUSES FAILURE

It often surprises me that so many people fail in the poultry business. I think it generally arises from the neglect of little things.

"Little drops of water,
Little grains of sand,
Make the mighty ocean,
And the wondrous land."

An egg after all is but a little thing, but what a wonderful little thing it is! A wonderful provision of nature for furnishing every element necessary to the support of man, in the best proportions and in the most palatable form.

It seems as if the supply of eggs will never be sufficient to meet the demand, and with such a demand why should people fail in the business?

I. K. Felch once said that it is making a low estimate when we say that three fifths of our seventy million people under our flag will drink tomorrow morning coffee made palatable and nourishing by the use of eggs; two-fifths of this great throng will make their breakfast in part or wholly of eggs; fully half of this number will partake of a dinner the make-up of which has involved the use of eggs, and more than one-half of the population will eat for supper eggs in some form, tea-cake, custard, pumpkin pie.

It has been estimated that over two million dollars worth of eggs are annualy imported into this country. which fact does not look as if there is a prospect of overproduction within many years. The prospect in fact is bright for the successful egg producer, then why do so many fail?

At the Farmer's Institute last month at Gardena was a gentleman whose wife over two years ago had written to me from Denver, asking for advice about starting in the poultry business. I replied as fully as I could. sending her, if I remember rightly. a copy of the Los Angeles newspapers and the Cultivator.

Health was their first object and some out of doors employment that would bring in living wages.

They came, settled in Gardena, fortunately for them, for Gardena is an Eden for fowls, went into the chicken business, and succeeded from the first.

* * *

"Do you think there is money in eggs for market?" was one of the questions propounded at the Institute. This question was most satisfactorily answered by Mr. C. W. Stephenson, who stated that there was money in it for anyone who succeeded! He added moreover, that a great many failed, and that he himself had at one time nearly "gone under." After the Institute was over he and his good wife told me that they kept an accurate account of their receipts and expenditures, also of the number of eggs from the various pens, the amount of food eaten and many other interesting details.

"Our hens laid over fifty thousand eggs last year," said Mrs. Stephenson, "they averaged 136 eggs each."

"I have some of your stock," said Mr. Stephenson, "and that pen averaged a hundred and ninety-six and two thirds eggs per year. and," he added," there was one of yours that laid one hundred and five eggs in one hundred and ten consecutive days."

He also gave me some interesting facts in regard to the profits and expense of his fowls last year. He is only a novice, came to California in bad health, but has "grit" and is winning both health and a fair income. This year he intends trap-nesting all his fowls, discarding the unprofitable among them, consequently his returns will be much larger.

Amongst the interesting details by his books was the fact that each hen last year cost him $1.12½ for food including grit and shell. The average price obtained per dozen eggs for the year was 28 cents. The average net proceeds from each hen (good and bad layers together) as about $2.05. In making up these averages many interesting facts were disclos-

Petaluma Incubators and Brooders.
The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the GOLD MEDAL at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?
St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A FILCHER, Commissioner.
And Now Comes New Reward for Merit:

I have been breeding thoroughbred poultry for over 20 years and have as fine stock of these varieties as there is on the Pacific Coast.

I also hatch and can supply little chicks from a dozen to a thousand from the above varieties delivered anywhere within 72 hours of San Jose. Prices on application.

J. S. Smith, Box 526, San Jose, Cal.
YARDS—CORNER MOORE AND CHAPMAN STS.

ed for instance the average net proceeds per hen for one breed per year was $2.25 per hen and the net proceeds of another breed was $3.43 per hen, while in the case of mongrels the net proceeds per hen was $1.50, proving to him that Standard bred hens are much more profitable than mongrels.

Mr. Stephenson told me that he had been following as closely as possible the directions for feeding and care of fowls given in the Cultivator that he had written to Berkeley for the bulletin on Chicken food, (Farmer's bulletin No. 164) which I have so frequently advised our readers to get,and that he mixed his fowls' food by one of the formulas in that. He said that it was a surprise to him to see how the eggs began to multiply in two weeks after commencing that feed and he thought it was to that he owed his success in getting eggs in the winter when eggs are always a good price.

I was more than glad to find that my "line-bred" fowls had fallen into the hands of a man who not only appreciated them, but who would continue to breed them on the same lines. I have since heard from another party who has some of the same strain that she purchased from Mrs. Durfee, one of our advertisers, that one of the pullets which she is trapnesting has twice laid two eggs in the same day.

Very satisfactory news to me who for seven years worked and studied over "line-breeding" and other kinds of breeding to promote a large egg yield. Others are now reaping the rewards of my labors, for I am not now in the business.

* * *

EDITOR'S QUESTION BOX

Liver Complaint. (Mrs. G. S.) Yuba City. Editor Cultivator—I have read the poultry page in the Cultivator for some time and have not yet found what I would like to know. And I will allow myself to ask you a question. My chickens have a disease which is catching. I have been feeding them wheat and corn this winter. By opening them I find they all have a big liver and some of them have little white, hard spots in it. They are mostly all young chickens, some of them go for quite a while before dying. I shall be very glad if you will inform me what to do.

Answer. Your chickens have liver trouble. It usually comes from feed-much starchy food, or a ration wrongly balanced. Too much corn will do it, or too much potatoes. Now to cure it put the chickens if possible on to fresh ground, give them more green food and more meat, also for a week give them sulphate of magnesia, half a teaspoonful for each bird in the drinking water. Or give each bird half a teaspoonful of castor oil. After this you must depend upon the better balanced ration, giving more green food, and making the chickens scratch and work to dig out the grain.

* * *

Muscovy Ducks. (E.McD., Hollywood.) Editor Cultivator—Will you kindly give me some information concerning Muscovy Ducks. Are they a good table fowl and do they mature rapidly? I was thinking of buying a setting of eggs, when some one told me they were a beautiful bird to look at, but not good for either laying or eating. What do you consider the best way to mark young chicks? Last year I used a punch. was very careful to take the piece of skin out that the punch cut and yet it grew together and I had just wasted time. I punched them the day they were hatched. Can you get leg bands small enough for little chicks.

Answer. Some people consider Muscovy Ducks good eating. I do not like them as well as goose or duck. They seem to have a fishy taste. They mature as quickly as a goose. They incubate their own eggs (thirty-five days) and make good mothers. They do not lay as many eggs as others and I found them cross to children. I always mark my chickens with a good punch. I do not like leg bands for little chicks, but have marked them at first with a dab of red paint on their heads, and before that wore off I sewed a small piece of scarlet worsted braid on one leg (a black braid on another brood.) I found the

FEED THIS MUCH AT OUR RISK

THIS IS THE MONEY BACK LINE

PROVE PURINA FEEDS ON OUR NEW SELLING PLAN We have arranged a plan for the introduction of PURINA POULTRY FEEDS throughout the Pacific Coast which will appeal to every poultry raiser who is looking for more eggs and more chickens. We take all the risk and agree to let you give our Feeds a trial *without cost to yourself.*

We have two of the largest Rolled Oat Mills on the Pacific Coast. This means that that we manufacture a large amount of Oat Shorts, Oat Middlings and Oat Groats. In each one of our Poultry Feeds we use a very large percentage of these *Oat Products* and it is on this account that we can claim more nutriment —better results—more eggs.

TRIAL OFFER

We will send (freight prepaid) four 40-pound sacks for four dollars. The assortment is as follows:

1 40-lb. Sack Purina Mash
1 40-lb. Sack Purina Scratch Feed
1 40-lb. Sack Purina Chick Feed
1 40-lb. Sack Acalfa Meal
ALL FOR FOUR DOLLARS

In each case you may feed down to the "money back line." If the feed is not satisfactory, just tie up the bag and write us. We will refund you your money and tell you what to do with the remainder at our expense.

Write us for samples and for other information.

Buy From Our Factory—Save One-Third.
PRACTICAL INCUBATORS positively the best. Hatches more and stronger chicks. 10 YEARS GUARANTEE
Cat. free. PRACTICAL INC. CO., 720 S. 11th St. San Jose, Cal.

Why do you pay $5.00 to $8.00 per hundred for eggs for hatching when you can get just as good eggs from just as good stock from us at one half that price? Our stock is large and healthy. The hens lay lots of large white eggs that run as high as 98% fertility. We sell eggs in incubator lots only at $2.50 per hundred.
Avenue Poultry Yards, Ventura, Cal.

braid was elastic enough not to hurt them as they grew larger. I have punched hundreds if not thousands of chicks and never have known them to grow up. With ducks the holes always grow up, but a little puckered mark is left.

* * *

Leghorn Description. (L. A. M., Monrovia.) Editor Cultivator.—This is the first time I have written and am going to ask a few questions. Is charcoal taken from the stove all right for chickens? Is it necessary the hens should have a hot or cold mash? Does a mixed diet hurt them? Is not sand good for the floor of chicken houses? Please give me the description of a standard bred Brown Leghorn cockerel and pullet.

Answer. Charcoal from the stove is just as good as any other for fowls. It is not necessary for hens to have either cold or hot mash. If you have table scraps of bread, or meat or cooked vegetables pour a little water on them either warm or cold and mix some bran with it. The hens like this very much. A mixed diet with as much variety as possible is the best for hens. It makes them lay. For full description of Brown Leghorns you had better consult the Standard The Leghorns are one of the Mediterranean breeds. They are layers of medium sized white eggs; they have creamy or white earlobes, smooth, yellow legs, long, full tails. black in the male. The males are very handsome, the coloring being of the black red so greatly admired, whilst the females are of a modest brown. The comb of the males should be perfectly upright with five spikes, that of the female should droop to one side.

* * *

Roup. (H. C. C., Palmero.) Editor Cultivator—I have some Plymouth Rocks. Some are two years old and some are last spring's hens, that seem to be afflicted with breathing hard, they seem to have something the matter with their wind-pipe. I noticed one or two had a white, foamy substance come from the left eye, and another lumps on the right foot. They all seem to be so lazy. They all have something the matter with their throats. want to gap so much, and they open the mouth just as wide as they can. The droppings are of a light greenish color, and have dark spots.

Answer. I am sorry to say your fowls have roup. Some of them may also have gape worms in their windpipe. Give each one a pill of assafoedita, then pour a cup of kerosene (coal oil) into a pail holding two quarts of water, dip the head of the hen into this slowly, hold it in while you count three. Do this twice a day.

Give them plenty of onions chopped fine and mixed with bran. This will kill the gape worms and will cure the cold. Onions are very healthy for fowls.

THE BRONZE TURKEY

Ed Hart of Clements, Cal., is the author of a pamphlet on the above subject, which is interesting and instructive. It is generally conceded that the Bronze turkey is the largest and handsomest of the turkey family. The hen will lay often twenty eggs or more before becoming broody. The old toms weigh around 30 pounds, the hens 20 pounds, sometimes, however, they weigh much in excess of these figures.

* * *

In his article Mr. Hart makes a few suggestions on the care of turkeys which are practical and beneficial and are here given as worthy of careful reading and study. Among other things, he says:

"First, get good healthy birds. For breeding take the young and thrifty of both sexes. Procure these early in the season so that the birds may get used to their houses before they begin to lay.

We shall give briefly a few suggestions in regard to raising turkeys, their ailments and remedies, intended to help beginners. To those who are experienced and have been successful, it does not mean you.

First, get good healthy birds. I prefer for breeders the young and thrifty of both sexes. These should be procured early in the season, to get used to their new home.

Standard Bred S. C. White Leghorns

EXTRA LARGE BIRDS AND HEAVY LAYERS. Eggs, $2 per 15; $8 per 100; $60 per 1000 from January until July only.

LAYING HENS

We have a few choice 1½-year-old Thoroughbred White Leghorn hens, which we are offering at a sacrifice In order to make room for our young stock we are offering these fowls at $15.00 for 12 hens and 1 rooster or $100 per 100.
We also have a number of 5-months-old pullets, also of the same variety, on which we can name you the same price. If your stock needs renewing, send in your order at once, as they are going fast.
We have a Hatchery of 50,000 chicks per month capacity, from which we are making shipments daily to all parts of the Coast. If you need any just hatched chicks have your order booked at once, so as to get them on the date desired. Our price for just hatched chicks is $7.50 per hundred f. o. b. Petaluma.
We manufacture the famous MUST HATCH INCUBATORS AND BROODERS and a complete line of poultry supplies of every description. We cater to the best hatching egg trade on the Coast.
Before purchasing write for our new illustrated Catalogue B which contains descriptions, prices, etc., of all our goods.
Must Hatch Incubator Co., Petaluma, Cal.

A Pedigreed Flock of Bronze Tuıkeys.

Leave poults on the nest until they run from under the hen. Dust hen and poults with Buhach when taken from the nest.

Food that is good for young chickens is also good for young turkeys. Cornmeal with about one-fourth wheat bran, well baked (even if burnt a little, so much the better) and fed dry, with a little coarse sand mixed in, makes the best feed I know of until they are 3 or 4 weeks old; at this time commence feeding clean cracked wheat or whole wheat until they get big enough to hunt their own food. They will do well from the start on clean cracked wheat alone; but whatever you feed, see that they get plenty of grit or coarse sand. Watch them; attend to their little wants; be patient and observing and success is yours, whether it be for pleasure or profit.

Eggs boiled hard and chopped fine with the shells, and mixed with the bread for the first few days, gives them a good start. Feed five or six times a day for the first few days, until they can be let out with the hen. Make any change of feed gradual.

Diseases will come. If the little poults should get diarrhoea, give ginger tea until relieved. Lime water is also good for them to drink . A decoction of blackberry leaves or roots is good, also.

For gaps, give a few drops of turpentine mixed with soft feed.

For sore mouth, clean off the canker and apply tincture of iron or tincture of iodine. To swab the mouth with bluestone water is a good remedy. When thus afflicted, give them the best stimulating food.

For curl toe, give a teaspoonful iodide of potassium to a quart of drinking water, for a few days, and coop on high, dry ground. Also dip their legs and feet in coal oil and wipe dry.

Chickenpox or sorehead may be treated first by giving the whole flock a tablespoonful of Epsom salts in a gallon of water or feed. In addition to this take equal parts of pulverized table salt, bluestone and lard, mix well and grease head and face of fowl.

Indigestion is often called cholera from their excrements being yellow. If treating a full grown bird, give from one to two teaspoonfuls of Jamaica ginger in three or four tablespoonfuls of water. A piece of bluemass the size of a hazel nut is also good.

A good remedy for indigestion and many other complaints in grown turkeys is to scrape a piece of common soap fine, sprinkle it with red pepper (all it will hold). roll up in a piece the size of a cherry and give.

A chew of tobacco put down an ailing turkey's throat will often give a new lease of life.

At the latter end of summer, put a little bluestone in their drinking water, to keep them in a healthy condition.

On the approach of cold weather and just before the first storm, a soft feed, with red pepper, will help to ward off many a disease that often happens at this time.

Crop Bound.—In bad cases take a sharp knife, cut a slit in the crops to insert a teaspoon, by which clean out the contents of the crop; then wash out with a little warm water containing half a teaspoonful of baking soda to a pint of water; then sew up.

Water Crop.—Empty crop by holding up the legs, head down, manipulate the crop; then inject a little warm water containing 6 drops of carbolic acid to a pint of water; rinse out and empty again. Then give in their drinking water 10 drops of nitric acid to ~ pint of water.

In dosing the turkey, throw the head well back, open the mouth and feed with a syringe or tube. (Give half-grown birds one-half the dose.)

Veterinary

BY DR. W. J. OLIVER,
318 East Second St., Los Angeles

VETERINARY SURGEON NEEDED

Editor Cultivator.—I have a horse which had a shoulder bruised several weeks ago. It festers and I opened it three times. Pus does not seem to gather any more but the swelling around the sac remains hard and sensitive. There seems to be a growth on the bone underneath. What should I do for it? Answer in Cultivator. H. J. C., De Luz.

You must have the fibrous growth dissected out. This is the quickest and best way to get rid of bunch. Then use a solution of sugar lead and sulphate zinc of each two ounces to quart of water.

COCOANUT MEAL

Editor Cultivator—Will you tell me the feeding value and also the fertilizing value of cocoanut meal when fed to cattle. A. A., Sierra Madre.

The digestible nutriments and fertilizing constituents in cocoanut meal is tabulated as follows:

Dry matter in 100 pounds 89.7; digestible nutriments in 100 pounds, protein 15.6; carbohydrates 38.3; nitrogen 32.8; phosphoric acid 16.0. potash 24.0.

Cocoanut meal has the reputation of producing fine butter of considerable firmness and is therefore recommended for summer feeding to the dairy cows. The fertilizing value of the meal is shown in the table given above.

Pomona is to have a new ice plant, With a capacity of thirty tons daily.

The State Board of Health bulletin for January contains some interesting reading on diseases in California. One item is this: "Of all who died of tuberculosis in Southern California 4.1 per had been in the State less than a month, altogether 12.7 per cent. less than 3 months, and altogether 17.3 per cent. less than 6 months. In Los Angeles 16.8 per cent., and in the other counties 18.3 per cent. of the total victims of tuberculosis had lived in California less than half a year.

In Southern California the departure of February was somewhat after the order of the usual March in the East. In Upland we had snow, sleet, rain and a biting cold northwest wind. Thursday morning we had a very white frost, but no damage seems evident.—Upland News.

The San Diego Postoffice was robbed Monday morning, the safe being blown open and over $10,000 in money and stamps taken, more than half of which was in gold coin.

One of the largest and best real estate firms in San Francisco, Chas. F. O'Brien is advertising the famous Gridley Colony in this paper. Write to him, Dept. 47, No. 30 Montgomery St., San Francesco Cal., for free information.

In their new quarters on Market Street the big San Francisco firm of Woodin & Little are better than ever prepared to furnish their customers the very best machinery in all lines pertaining to the farm and ranch. Their advertisement appears in this issue and our readers can be assured of the best of treatment. Write them for catalogues and prices.

Judge T. E. Orr remarked at the recent San Francisco show that the White Wyandottes exhibited by the Capital Avenue Poultry Farm, of San Jose, were amongst the whitest of the whites which he had ever seen. He has also written in the Reliable of the quality of these birds which he says would be strong competitors in Madison Square. Mr. Martz certainly has fine birds as the writer, who has seen them, can testify.

Pascal Dubedat & Co., 218 California St., San Francisco, Cal., dealers in Imported Sublimed and Powdered Sulphur are advertising in the Cultivator and those who want the very best sulphur for bleaching and spraying fruits and vines should write them for prices.

No creamery appliance attracted more attention at the National Dairy Show held in Chicago, the closing week of February than one or two models of milking machines. Owing to the fact that all cows brought to the show were blooded their owners were reluctant about allowing them to be experimented with for machine milking.

Half of the success in poultry comes from having houses, yards and appliances convenient, also suitable to the comfort of the birds. Such a yard we recently visited at Santa Ana. It is that of Geo. H. Randall. His houses are mostly portable and the runs large. As the houses need cleaning they are moved from place to place and the former ground is spaded up left to purify till the house is again, some months later put over the same ground. The pens are 40x80 feet and the houses 6x8 feet which accomodate about 40 birds. One feature worthy of note is the suspended perches. No chance of harboring mites.

Mr. Randall pins his faith largely upon, White Leghorns, but at the same time has some prize winning Buffs and W. C. Polish as was proved at the recent Los Angeles show.

ARE YOU READY FOR HARVEST

How about it?

Old Mother Earth, the sun and the showers, the dews and the winds are doing and will do their part to produce the wheat and oats and rye and barley that go to make a bountiful harvest.

Are you doing *your* part.

Are you getting ready to *harvest* the crop after it is grown?

Do you know *how* you will cut your grain?

Are you sure you will harvest it to the best advantage—with the least loss of grain, the least waste of time, the least trouble and worry and expense?

These are mighty important questions, for a large share of your *profit* depends upon them.

It's not too early to begin to think about them.

With high priced land and high priced labor, you need to get every cent from every acre you cultivate.

Help will be scarce and expensive; therefore, you need a harvesting machine that will save you the most labor.

Harvest days are few; therefore, you need a harvesting machine that will save you the most time.

Grain is worth money; therefore, you need a harvesting machine that will save you the most grain.

You can't afford to run risks.

You can't afford to take chances.

And you don't have to.

Take an hour or two, now, before you get too busy and talk to any agent of the International Harvester Company of America, and find out about the International line of harvesting and haying machines for 1906.

You'll be interested whether you buy or not.

* * * *

Buying a machine of any kind for use on the farm is not as simple a matter as it may seem.

You can "size up" a farm and know pretty accurately how much an acre you can afford to pay for it, but unless you are a mechanical expert you can't judge a machine in the same manner.

You have to take other things into consideration. For example:

You need to know something about the design—the mechanical principles—how the machine works.

You need to know something about the materials used in it.

You need to know something about the skill used in its construction.

You need to know something about the responsibility of the man behind it and about the machine's reputation.

The International Harvester Company line of machines for 1906 will satisfy you on these points—and on every other point that you may bring up.

* * * *

Bigness is not necessarily a merit in itself.

If you're buying a horse you don't care very much whether the man who raised it, raises one colt a year or 500.

But you know that the man who makes a specialty of horse breeding is more likely to raise a hundred good colts, than is the man who goes at it in a hit-and-miss, haphazard manner.

It's the same way with farm machines.

You don't care whether a manufacturer makes 1,000 or 100 000 of them, just so the *machine satisfies you.*

But there's this to take into account:

The first harvesting machine was largely an experiment.

For fifty years inventors and manufacturers continued to experiment, making changes and improvements, adding this and taking away that, until finally a half-dozen harvesters began to stand out head and shoulders above the others.

Why do you suppose that was?

HOW did it happen that the Champion, the Deering, the McCormick, the Milwaukee, the Osborne and the Plano increased in popularity and sales so much more rapidly than the hundred and one other harvesting machines that have been put on the market at various times in the past 50 years?

There is only one reason for it.

They met the demands of the farmer, and satisfied his needs.

In the expressive language of the day, "they made good." They are better today than ever before; they do better work and give greater satisfaction.

And here are the reasons:

1st.—The mechanical principle is right.

The manufacturers of the Champion, the Deering, the McCormick, the Milwaukee, the Osborne and the Plano, by *co-operation* are able to include in their respective machines every device, every invention, every mechanical principle yet discovered that tends to make a harvesting machine *do better work.*

By co-operation they are able to maintain such experimental shops as the world has never seen before, making certain that every improvement and every device that mechanical genius can contrive will be employed in their line.

2nd.—The materials are right.

By co-operation they are able to own, control and operate their lumber camps, their own saw mills, their own coal and iron mines, their own coke ovens, their own steel mills, relieving them of the necessity of depending upon the uncertain and fluctuating steel markets, coal markets, lumber markets, etc., for their raw materials, and insuring them at all times an abundance of materials which they *know* to be right. These are added reasons for the superiority of these harvesting machines.

3rd.—The workmanship is right.

The demand for these six leading makes of harvesting machines enables their manufacturers to maintain manufacturing plants of the highest efficiency and to employ workmen of the highest skill—factories and workmen which could not by any possibility be maintained to supply a small demand.

4th.—Their reputation is right.

The fact that so many farmers cannot be persuaded to buy any other,—the fact that so many farmers continue to buy them,—the fact that they are considered the standard wherever grain is grown in every part of the world is sufficient indication of their reputation and their reliability.

* * * *

You probably need one of these harvesting machines.

You cannot afford to begin harvest with a machine that is liable to break down and cause you several days' delay.

You cannot afford to use a machine that loses a few stalks now and then and a whole sheaf here and there, for a little leak like that eats into your profits at a surprising rate.

Go to the dealer *now*, and get which ever catalogue you want.

If you don't know an International Dealer—write to nearest branch house.

International Harvester Company of America, (INCORPORATED) **Chicago, Illinois.**

Queries and Replies

MUSHROOMS

"Constant Reader," San Martin, is advised that we have lately published several articles on mushrooms. For further information write to the Dep't. of Agriculture, Washington, D. C., for the latest bulletin of the subject, by Prof. B. M. Duggar.

RE-FORESTATION

To H. C. M., and others interested in re-forestation, we would advise writing to the "Forest Service, U. S. Dep't of Agriculture," Washington, D. C., regarding their co-operative offer whereby it places its trained foresters at the disposal of those who wish to establish plantations of forest trees.

BENCH GRAFTING WALNUTS

Editor Cultivator—How is bench grafting of walnuts accomplished? Is it now too late? Any information on this subject through your columns will be appreciated. Subscriber, Anaheim.

It is now rather late for bench grafting and it is the most expensive method practiced. We do not think it either profitable or desirable in this climate and would advise doing all such work in the field.

GOPHER AND SQUIRREL POISON

Editor Cultivator:—J. R. M., El Cajon asks for gopher and squirrel remedy which I am pleased to answer with your permission. I have the best success with strichnine crystals on a small piece of orange applied in its runway covered to exclude the light, being careful to keep the dirt from soiling it. Have tried poisoned raisins, carrots and traps, but the orange beats them all. Poisoned wheat is a success for squirrels. H. S., Riverside.

BUDDING WALNUTS

Editor Cultivator:—Please tell me through your paper how to bud walnut trees. I am quite successful in budding other trees, but never have been able to get a bud to grow in a walnut. Subscriber, Toluca.

On Jan. 26th we published complete directions for walnut budding, covering one and a half columns of space. On Feb. 9th under "Wooly Aphis," the plate bud was described in detail. We cannot re-publish until the proper season next year.

ORANGE RUST OF BLACKBERRY

The blackberry canes submitted by "Moneta Subscriber" last week, were sent to Prof. R. E. Smith, of the State University, and he replies as follows:

"Your subscriber's blackberry vines, sample of which I have just received from you, are affected by the so-called "Orange Rust," a serious fungous disease of this plant.

"There is no remedy for the trouble in plants once affected, as the fungus is perennial; i. e., it grows down through the stems into the roots and is thus impossible to reach with any treatment. The best course of treatment is to spray the patch heavily with Bordeaux mixture, inorder to check the further spread of the rust, and either now or in the fall, cut out the affected canes and let new ones come up. If the vines are badly affected one can only pull them out entirely and start new. The disease is not always very destructive, and berry patches are often seen which bear well, even when a good deal of rust is present."

OUT OF OUR LINE

Editor Cultivator.—Can you send me the plan of a three-horse evener to work on a tongue? R. B. H., Tulare.

You will find what you want at some farm Implement store, in Hanford, doubtless. We can not give you the plan.

FOUND $50.00.

A. D. Rezendes, a poultryman living near Tomales, bought a sack of **Coulson's Special Dry Chick Feed**, and when he opened it he found $50.00. There are several more of these prize sacks floating around the country somewhere.

ADVERTISING RESULTS

The test of a paper's value as an advertising medium lies in the results it brings.

It is the aim of the Cultivator to encourage a trial advertisement of those who have not heretofore tried the paper. The growth of advertising in this paper is largely due to the fact that we give our advertisers the very best results.

The following letter, one of the many received by this office, is a handsome testimonial to the merits of the paper as an advertising medium:

Loomis, Cal., March 2., 1906.

California Cultivator,
Los Angeles, Cal.

Gentlemen: Our advertisement in the Cultivator is bringing in about fifteen letters a day; so we enclose another advertisement.

A. Mitting, Mgr.
California Carnation Co.

The Imperial Nursery Co.. of Imperial wishes to purchase a lot of Red Gums. See their advertisement.

Have you noticed Dillingham's card advertising prize-winning strains of White and Buff Wyandottes?

D. E. Allison & Co., of San Francisco, will buy your chickens and eggs and give you good treatment. See their card on poultry page.

Lindgren Bros., of Kingsburg, were awarded commissioners' cup for best display of California bred poultry at the Lewis & Clark Exposition. They are among the permanent advertisers in the Cultivator.

ChinoRanch

Fertile Lands
$75 to $200 an Acre.

You can't be too careful in purchasing Southern California acreage. Whether you buy for home or investment purposes, there are many important factors to consider, chief of which are: Water, Soil, Climate and Transportation Facilities.

Authorities state that the Chino Ranch is the richest water-bearing tract in southern California. A recent State Agricultural Report says, "In respect to possibilities of vegetable growth the Chino Valley surpasses any other district of the Department. The climate is practically perfect, and three trans continental railroads cross the property." Therefore, the Chino Ranch successfully meets the four vital conditions named above.

Call at our offices for booklets containing specific information relative to crop records, agricultural reports—in short, the interesting truth about Chino and its opportunities.

BATTLE HYMN OF THE REPUBLIC.

When the people announced the other day, the serious illness of Julia Ward Howe, memory went back to the days of the Civil War when the "Battle Hymn of the Republic" was written in the fall of 1861, just after Mrs. Howe had attended a review of union troops near Washington. It was Mrs. Howe's desire to give more inspiring words to the "John Brown" melody.

If the author of the "Battle Hymn of the Republic" lives until May 27 next she will be 87 years old.

The "Battle Hymn of the Republic" was written to the melody of "John Brown's Body." The words follow:

Mine eyes have seen the glory of the coming of the Lord;
He is trampling out the vintage where the grapes of wrath are stored;
He has loosed the fateful lightning of his terribly swift sword;
His truth is marching on!

I have seen him in the watchfires of a hundred circling camps,
They have builded him an altar in the evening dews and damps,
I can read His righteous sentence by the dim and flaring lamps;
His day is marching on.

I have read a fiery gospel writ in burnished rows of steel,
"As ye deal with my contemners, so with you my grace shall deal;
Let the Hero, born of woman, crush the serpent with his heel,
Since God is marching on!

He has sounded forth the trumpet that shall never call retreat;
He is sifting out the hearts of men before his judgment seat;
Oh, be swift, my soul, to answer Him, be jubilant, my feet!
Our God is marching on.

In the beauty of the lilies Christ was born across the sea,
With a glory in his bosom that transfigures you and me;
As he died to make men holy, let us die to make them free,
While God is marching on.

The Proposal

The garden was wonderful in its fresh spring beauty, the delicately tinted lilacs, the fruit trees that were one immense bank of bloom, and the sunshine that played upon it all, throwing some of the colors in high relief and shading others, glowing richly in the soft shadows; tender and whisperings were all that broke the silence.

Jean de Gace, as he opened the gate, drew in a long breath of happiness. From where he stood he could see the green sweep of the lawn, the graceful trees and winding walls; his heart grew light, and smiling, he bowed deeply to this paradise.

A white skirt fluttered near the edge of the little wood, moving with a quick rustling motion; he recognized the parasol, the dainty, rose-colored waist and the white skirt, and as the owner of the parasol turned the corner he caught a glimpse of a beautiful face.

M. de Gace felt happier and younger than ever; his forty-five years slipped away from him as a dead leaf from its branch; he did not know what it was to grow old. He had married very early in life, and his wife, whom he adored, had died soon after the birth of their son; and since then, on account of the passionate eagerness with which he had thrown himself into his work, he had scarcely perceived the passing of the time. There was no touch of white among his brown hairs nor in his short moustache, and his step was quick and alert.

But during the last year, since the Mainfroys had moved into the country house that adjoined his own estate he had grown younger than ever; he had scarcely noticed that his son Robert had left for Japan, as attache to the French embassy, nor that Miss Maud, his finest mare, had suddenly gone lame. He was absorbed in one dominating thought that he was in love with Helen Mainfroy, and that, in all probability, should he ask her hand, it would be given him.

Suddenly she called to him.

"I have just been down to see your horses run; Norfolk is simply superb."

M. de Gaee was enchanted, not with the compliment bestowed upon his horse, but with the bright joy of Helen's smile. He looked longingly at her, delighting in each fresh aspect of her beauty and then feeling that it was for him to make some reply, he asked:

"Is your father here?

"Yes," she answered, conscious of his emotion, " he is settling his accounts in the summer house. I heard the little tinkle of a bell by the garden gate, and thinking it was you, I came to meet you."

"How good of you—Guess, if you can who dropped down upon me yesterday, fresh from the skies. or rather from another world?"

"From another world?"

"Yes; it was Robert, my young diplomat. I didn't expect him for another month, but he came through without stopping, and arrived without even sending me a telegram. He seemed to think it was an everday affair to come back from Japan."

"I shall be very glad to meet him," said Helen, lowering her parasol.

"One reason of my coming here now was to ask your permission to bring him to call to-morrow," said M. de Gace slowly. He was silent for a moment, if to give more emphasis to his words, and then went on, his words coming crisply and his eyes fixed upon the ground.

"Robert is now definitely settled, his career is established, and he has nothing to do but to go ahead; he was still a good deal of a boy when he left for Japan, but he has come home a man; I do not need to worry any longer about him. And it is this fact that has decided me to take, with your father's permission, a step with whose nature I have already acquainted him."

In spite of himself, the man looked up to watch the effect of his words; Helen was standing motionless with the quick color playing about her cheeks. Her little hand trembled upon the handle of her parasol as she traced vague patterns in the garden walk.

M. de Gaee longed to take possession of this little hand to tell her how much he loved her and ask her if she would be his wife. He felt instinctively that the moment was divine. Had he been younger, he would have done it without pausing for an instant, but certain ages have their certain bashfulness. He was silent, timid and trembling as if he had been only twenty.

"You know we are always glad to see you," said Helen simply, breaking the long silence.

"Very well, then, I will come tomorrow. I will not disturb your father now."

"Why, are you going already?" We have scarcely seen anything of you lately."

"You are good to say so."

Yes, Helen was good, she was beau-

tiful and she was charming. M. de Gace kept repeating the words to himself as he walked beneath the tall, spreading elms, where, at the end of the driveway, a groom stood waiting holding his horse. With naive care he constantly assured himself of her love, remembering how she always came to greet him, and her smiles and soft handshakes. Was it, after all, only sympathy that she felt for her lonely, agreeable neighbor? But, no, she had blushed just now, she understood the hidden meaning of his words, and she had said "tomorrow." Besides, he had already spoken to Mr. Mainfroy, perhaps Helen's father had told her.

He stopped short, reining in his horse suddenly.

"What if she only wants to marry me because I am rich and the Baron de Gace."

He drove the thought away with a quick exclamation of anger, knowing it unworthy of the girl he loved, and touching the horse with the spurs, he galloped home. As he turned the corner, he saw his son Robert flashing down the road in front of him, on his bicycle, and from his seat upon the splendid animal M. de Gace compared simself with his son, thinking rapidly:

"On the whole, I am better than he."

* * *

The next day as the father and son entered the Mainfroy's parlor, they surprised Helen arranging her flowers. She had not looked for them so soon, and had not heard the cariage and supposing herself alone for some time yet, she was still dressed in her loose, morning dress, her arms bare and her hair simply tied with a ribbon. M. de Gace uttered an exclamation at the lovely picture she made among her flowers.

"Mercy me, let me run away!" she cried, seeing them stand suddenly before her.

"Before you go, please let me introduce my son," said the baron smiling, "and please forgive us for coming so soon. We really couldn't wait."

Blushing rosy red, Helen lifted her eyes to those of the young man, standing so tall and straight before his father. Their looks met and lingered. A moment later she had disappeared closing the door behind her.

"Great heavens!" cried Robert. "how charming she is, and how pretty.

"You think so?" queried his father.

"Yes, indeed, and I understand better now what you seemed to be hinting at yesterday, dad; I assure you that if this is the lady of your choice, I am more than ready to fall in love with our plans. But do you suppose she would be willing to go off into foreign lands? For my career—"

He was interupted for just then M. Mainfroy entered.

"My daughter has told me, my dear baron," he began heartily, "and I understood immediately. You know what a daughterly affection she has for you and knows what a fine man you son is, we will speak frankly, will we not? We must wait a little to see how the young folks get along together, and then—"

M. de Gace looked at his son, whose eyes were shining brilliantly, and without a single muscle of his face betraying him, he felt the agony in his heart.

"Thank you sir." he said quietly, "for your kind words about Robert, I hope you will allow him to come here often, for I think they will please each other. Robert's a good fellow—"

And he added simply.

"And Miss Helen is an adorable young lady."—Francois de Nion, in Washington Post.

Try this for a winter dish that will please all: Pop some corn nicely and roll it as fine as possible. Mix a pint of the corn into a quart of sweet milk; add a small piece of butter and a teaspoonful of salt, beat two eggs with enough sugar to sweeten the milk; mix all together and bake for 20 minutes. Serve as pudding.

When cleaning up the room place a light covering over the winter plants to keep the dust from settling on them.

It is a good plan when sweeping and dusting the rooms to have the doors and windows open—the dust goes out and fresh air comes in.

Cookery Recipes

COCOANUT MILK CHOCOLATE

Heat a quart of milk in the double boiler, and when very hot stir in four heaping tablespoonfuls of grated unsweetened chocolate, moistened with a little cold water; allow it to boil and thicken; have ready nearly a pint of cocoanut milk, into which has been stirred half a cupful of sugar and the whites of two eggs; add this to the chocolate, and cook for a few minutes but do not allow it to boil. Remove from the fire and serve in chocolate cups, adding after it is poured into the cups a tablespoonful of sweetened whipped cream that has been mixed with a little of the grated cocoanut.

* * *

Separate four eggs; beat first the whites, then add the yolks and beat lightly; dissolve one cup of sugar in a pint of cold water, add to it the juice of four lemons, and then a small quantity of cracked ice; stir the eggs carefully into this and use at once.

* * *

PEPPERMINT CUP

Soak half an ounce of pulverized gum arabic in half a cup of cold water for thirty minutes, then dissolve it over hot water; add one cupful of powdered sugar and cook until it will spin a thread; pour this upon the stiffly beaten whites of two eggs, and when well blended add very gradually a pint of boiling cream, a few drops of essence of peppermint and a tiny pinch of baking soda. Serve while it foams; sprinkle with a little powdered cinnamon.

* * *

GINGER CORDIAL

Stew slowly together a half pound of figs, half a teaspoonful of allspice, a pinch of ginger, a saltspoonful each of cinnamon, mace and ground cloves and sufficient cold water to cover the ingredients. When the figs are tender remove from the fire and press thro' a puree sieve, returning the syrup thus obtained to a clean saucepan, and adding three pints of ginger ale; allow this to heat gradually and then add a scant teaspoonful of cornstarch mixed with a little cold water. stirring constantly until it boils; flavor with a few drops of lemon juice and serve in small cordial cups, capped with a little chopped candied orange peel.

HOW TO RESTORE LEATHER.

To clean and restore the kind of leather that is used on furniture:

Dip a soft woolen cloth in boiling milk and wipe the leather with it, rubbing gently until all the dirt is removed. Then wipe the leather dry with a soft flannel. When it is clean go over the surface with a piece of flannel on which is spread a thin layer of prepared wax about as large as a pea. After waxing, go over the leather with a clean flannel, rubbing briskly but not too hard.

For the wax, cut two ounces of bees-wax into small bits and put them in a bowl, place the bowl in a pan of hot water on the back of the range.

When the wax is soft take it from the fire and beat into a quarter of a cupful of turpentine and half a tablespoonful of paraffin oil. It should now be used, but if it becomes cold before you are ready to use it, put it in a pan of hot water anl let it stand for a few minutes.

Ordinary black leather, such as is used for covering books, and handbags, if it has become faded or discolored, can be restored with a fine quality of shoe dressing.

Small Dorothy was visiting her grandparents in the country, and, seeing a quantity of feathers scattered over the hen yard, said:

"Grandpa, you ought to do something to keep your chickens from wearing out so."—Farmer's Wife.

We certainly met one self-made man on the street the other day. He could not walk straight—he made himself walk that way. His nose was red as flannel—he made it that way. Poor fellow. He ought to be ashamed of the job.

Rex Flintkote ROOFING

A New Standard of roofing excellence has been established by Rex Flintkote. Our fathers swore by shingles. But shingles were hard to lay and failed to hold their own—they dried, cracked, warped. blew away, and burned at the touch of a spark. Then came tin—harder than shingles to lay, yet it led in roofing popularity until it proved that in spite of paints it *would* rust and become leaky. Its ease of laying alone makes

Rex Flintkote Roofing

perfect for farm buildings. An ordinary farm-hand can lay it perfectly. It weighs so little as to be no strain even upon lightly constructed support. It is unaffected heat or cold, proof against fire from falling sparks, leak proof in rain or snow, and is the only roofing that effectually resists all kinds of chemical action—acid, alkali or rot.

WE SEND SAMPLES FREE

and also a book showing all kinds of buildings which, under all kinds of weather conditions, are proving the superiority of Rex Flintkote. Under no circumstauces accept substitutes, mixtures containing tar and paper that cost about half as much to make, yet sell almost at the Rex Flintkote price. The dealer who is looking to your advantage, if he cherishes your friendship and trade in the future, will prefer to sell you the genuine even though his profits are less and it costs you just a wee trifle more per square foot.

The Produce Markets

Los Angeles Markets.

Los Angeles, March 8, 1906.

Butter has taken the expected tumble, Board of Trade and Valley Creamery being now quoted at 55c per 2-lb. roll, a decline of 5c since last week. Receipts are heavy and a further decline is quite on the cards.

Eggs are up a cent, but it is doubtful if the advance will be maintained, as the supply is large with no prospect of lessening.

Celery and cauliflower are practically off the market, while the supply of green peas and beans is constantly increasing.

CANCER

IN WOMAN'S BREAST ANY LUMP IS CANCER

Mailed Free—How to Cure Yourself if Cancer is Yet Small—No Pain.

NO PAY UNTIL CURED—GUARANTEE— JUST SEND YOUR NAME

MRS. E. CROSTHWAITE,
954 Arlington Ave., Oakland, Cal.,
President Golden Gate Woman's Club,

Dear Dr. Chamley—I will state, your medicine cured a very large cancer in my breast 11 inches long, extending to my side and armpit in 14 days over 5 years ago. WRITE AND ASK HER.

Don't doubt, don't delay.

Mrs. A. L. Bailash, 332 Ohio Street, Vallejo, California, was cured at home of breast cancer; also her mother cured of cancer in both breasts. WRITE TO THEM. E. J. (Lucky) Baldwin, Arcadia, Cal., writes: Dr. Chamley cured a large cancer on my lip and two in my throat after X-Ray and other Doctors had failed. I will give $1000 if I fail to cure any cancer or tumor I treat before it poisons deep. You can't afford to make mistakes with Cancer. Life is surely worth sending your name. 130-page book sent free.

My discovery—a Pacific Island plant extract—has cured thousands of Cancers in from 10 to 20 days, after celebrated physicians and surgeons had declared them "as good as dead."

Address. **Dr. and Mrs. Dr. Chamley & Co.,**
, 25 Third Street, San Francisco, Cal.

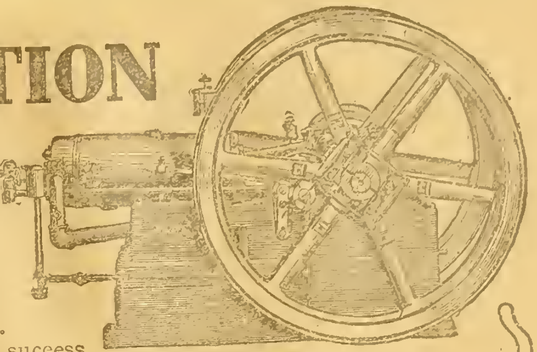
FOR **IRRIGATION** By **PUMPING**



For all those who wish to irrigate by pumping, the I. H. C. gasoline engine is the one best power.

The difference between success and failure in an irrigation pumping plant is often a question of fuel.

The I. H. C. engines use gasoline—a cheap and easily transported fuel.

They take the least fuel and convert it into the most power.

They are unequalled when put against a steady load as in pumping, and sustain their full rated power with persistency and regularity.

They can be belted to any centrifugal or direct pump for lifting water from wells, canals, streams, etc.

Anybody can run them without expert knowledge or previous experience.

They can also be used as a general [illegible] engine for sawing wood, [illegible] separating, feed grinding, etc. [illegible] are made in several styles and sizes—

Horizontal and Portable—4, 6, 8, 10, 12 & 15 Horse Power.
Vertical—2, 3 & 5 Horse Power.

Call on local agent and examine these engines or write nearest general agency for illustrated catalog.

The New Pomona Pump

We must not attribute all of the success of the Pomona Pumps to the Pump Head or the part of the machinery above the ground, for there is another part just as essential, and this is the cylinder and valves. Our cylinders are made of the best seamless brass tubing made to our order in the East. The valves are made of the best phosphor bronze and are cast and finished complete in our shop.

These valves are of the most improved pattern, have cone-shaped clappers with ground metal seats. There is only one moving part in each valve and we have never had them clogged with sand. The plungers are furnished with three cup leathers, each made from the best oil tanned leather.

With the New Pomona pumphead using a quick return motion and lap in the plungers, these valves have sufficient time to seat before taking up the load of the water columu, consequently there is no hammer or jar. The Pomona Pumps are taking the lead for irrigation purposes and are rapidly displacing pumps of inferior design and workmanship.

Send for catalog and estimates for our new plants.

WHO STOLE THE BUTTER?

A farmer owned a herd of milch cows that yielded him an average of 400 pounds, about 200 quarts, of milk per day. It was average milk, being 4 per cent butter fat. In other words the 400 pounds of milk his cows gave him daily contained 16 pounds of butter fat. This farmer had his milk tested, and knew it contained that amount of butter fat. He churned every three days and knew the cream from three days' milk should yield 48 pounds of unsalted butter. But it didn't. Instead of getting 48 pounds, he rarely got more than 25 or 26.

Who was getting the Cream?

His wife thought somebody might be stealing it, so he put a lock on the milk house door. That didn't help matters any.

He was puzzled. He had a first-class milk house, used the best system of deep setting, and couldn't see where that cream went. He let his milk stand until almost sour before he skimmed it, thinking it might cream better. But that didn't mend matters any—simply spoiled the skimmed milk for calf feed. Up to that time he had thought he had a perfect system of skimming. But he knew that 48 pounds of butter fat was there, because he had had his milk tested; but he could not make as much butter as he should.

He grew suspicious of his cans. It seemed to him that something was wrong with his cans. He asked his hardware dealer about it. This was the answer he got. "Look down your calves' throats." He asked the hardware man what he meant. The hardware man replied, "You have been robbing yourself—been feeding about half your butter fat in your skimmed milk. Your cans are good enough, as cans go— but cans don't do the business. They depend altogether on the force of gravity to do the skimming, and gravity is not strong enough. Half of the butter fat remains tangled up in the skimmed milk, and it takes a force a whole lot stronger than gravity to get it out."

"What will do it?" the farmer asked.

"Centrifugal force, as applied in the Sharples Tubular Cream Separator," was the reply.

This hardware dealer was an agent for the Sharples Tubular Cream Separator, and loaned this farmer a Tubular for a free trial. The farmer took the Tubular home, used it three days, churned 47 3-4 pounds of unsalted butter from the cream it extracted out of three days' milk, and sent a check to the hardware dealer in payment for the machine. He had been robbing himself, and did not know it. He had been making six-cent veal out of butter fat the Tubular would have enabled him to get 25 to 35 cents a pound for, when he could have made just as good veal out of oil meal costing but two cents a pound. The kindness of the Tubular agent in lending him a Tubular for a free trial enabled him to find the loss and stop it —making a gain for him of about 8 pounds of butter per day.

All Tubular agents are just as accommodating. Any one of them will lend you a Tubular for a free trial. If you do not know of any Tubular agent near you, we suggest that you write to The Sharples Separator Co., of West Chester, Pa. If you will ask for catalog No 260 they will not only send you the catalog, but refer you to their nearest local agent. The Tubular Cream Separator is a machine we can and are glad to, heartily recommend.

Flannery—What's the matter wid ye, Mike?

Finnigan—'Tis near kilt I was be fallin' down an open coal hole.

"Well, well, 'tis too bad they can't invint a coal hole thot'll stay shut whin it's open."—Philadelphia Ledger.

In California they do things on a large scale. You see flocks of poultry roaming on hundreds of hillsides as well as in the valleys, and on these hills are large poultry farms that are about a mile square, and the poultry houses are in colonies scattered throughout the fields.

The above is a bird's eye view of Mr. M. Sartori's Poultry Farm near Tomales. For the last two years the laying hens have been fed daily on Coulson's Mash Egg Food and Coulson's Chick Feed, 350 bags at a time. (About 5 wagon loads.)

Chicks, 2 Cents Each

Took from the incubator 831 chicks —fed them entirely on Coulson's Special Dry Chick Feed until 5 weeks of age—they ate 400 pounds of Chick Feed—nothing else—cost less than 2 cents per chick to feed them entirely on Coulson's Special Dry Chick Feed up to 5 weeks of age.

O. P. H., Petaluma, Cal.

Ask Your Dealer For It.

Feed It One Year

M. SARTORI

After we left the seaside we drove along at a lively gait through the valleys and canyons toward Petaluma and we very much enjoyed the scenery of beautiful rugged nature, for this country is wild and mountainous. and wherever we could see in the distance around us, we could see the foothills, or what may be called young mountains. As we were driving along we noticed that on some hills there were hundreds of cattle ranging, and on other hills were large flocks of sheep; but on the majority of the hills around us, and in the distance we could see groups of little white-washed poultry houses scattered a few hundred feet apart. At each group of these little buildings there was a colony of several hundred laying hens of the White Leghorn variety, and as we drove past them, we could hear them singing about Egg Food for hens; for they all wanted it, and if some of them did not get it, it was because their owners were too selfish and too blind to all interests of their fowls to give them what they so much desired. Coulson's Improved Egg Food, that makes hens produce $4.00 worth of eggs in a year.

The above illustration represents a photographic view of M. Sartori's 700-acre Dairy and Poultry Farm, fourteen miles from Petaluma. For more than two years Mr. Sartori has been feeding his laying hens Coulson's Mash Egg Food, once a day, and any one driving along the road will be surprised to hear the noise this great flock of hens do make. All day long they are cackling and singing and laying eggs, and they are probably talking to each other about how good Coulson's Improved Mash Egg Food tasted to them, and how many eggs they were going to lay, and who could lay the biggest eggs and the most eggs that year. It's no wonder that Mr. Sartori can come to town twice a week with a whole wagon-load of eggs.

The other illustration was a view taken four miles from Petaluma, on the road to the Sartori ranch, and shows the way Mr. Sartori buys Coulson's Egg Food for the pullets and hens and Coulson's Chick Feed for the little chicks.

4 Cents a Month

Reader:—You can feed a hen Coulson's Improved Egg Food once every day for 4c a month. Can't afford that? Why, two eggs a month will pay for the feed, and when you get 15 to 20 eggs from a hen in a month, think of the money you will make by feeding Coulson's Feed.

We Sell
COULSON'S SPECIAL DRY CHICK FEED
THE BEST FEED FOR LITTLE CHICKS AND TURKEYS
COULSON POULTRY & STOCK FOOD CO

The above picture was taken on O. P. Hall's poultry farm, showing one of the broods of young chicks then three weeks old, raised on Coulson's Special Dry Chick Feed, at a cost of 1c per chick for the first 25 days.

Mr. Hall will raise a few thousand pullets this year, to stock up his 100-acre poultry ranch. Another lot of 1500 chicks has just been hatched and the five incubators will be set several times more this season. Mr. Hall buys Coulson's Special Chick Feed in ton lots.

As seen from Middle Two Rock Road, four miles from Petaluma. By looking closely, you will notice the many small poultry houses. Each one is occupied by hundreds of chickens. The teams that you see are loads of Coulson's Egg Food and some Coulson's Special Dry Chick Feed, going to the different Poultry Farms, some of which buy a carload of Coulson's Foods at a time; for instance, M. Sartori, Geo. W. Gaston, A. D. Rezendes, W. W. Freeman and others, who have 5000 laying hens or more.

Some Practical Aspects of Seed Testing

By Miss Alice F. Crane

Nearly forty years ago Dr. Frederick Nobbe, of Tharandt, Germany, commenced investigations of the condition of seed trade in that country. His disclosures in regard to the poor quality and serious adulterations of commercial seeds resulted in awakening much popular interest in the subject, and finally, in 1869 organized Seed Control was established in Germany, with a station for testing commercial seeds. Now there are many of these stations in Europe Brazil, Japan, Java, etc.

During the past ten or twelve years much valuable work has been done on this subject by the U. S. Agricultural Department. Considerable has also been done by a number of Agricultural Colleges throughout this country.

We will not now discuss the necessity of Seed Control in this country. Such control will be welcomed by honest dealers. We look for the time to come when only seeds that reach a required per cent of germination and of purity will be allowed on the market.

More particularly, I wish to speak about weeds and weed seeds. But a little about germination tests first. Different seeds require different treatment, or different conditions, and a practical Seed Tester is supposed to know what are the conditions most favorable to the germination of the seed in question.

Testing Sugar Beet seed is a very interesting and a complicated piece of work. Some beet balls may produce from three to six sprouts. Each sprout must be carefully pricked out, and a record should be kept of how many sprouts to a ball. High percentage seed will keep one busy when germination is at its height. for each sprout should be removed before it separates from the seed. Sometimes this happens in the middle of the night. A report of Sugar Beet tested after the rules of Germany and France should state:

The average number of sprouts in 100 beet balls;

The average number of balls in one kilogram of seeds;
The average number of sprouts in one kilogram of seeds;
The percentage of moisture;
The percentage of purity;
The percentage of beet balls that did not germinate.

I have recently examined many samples of the last two crops of wheat grown in different sections of our State. A large number contained considerable barley and oats, either cultivated or wild oats. Also 70 per cent of the samples of wheat contained seeds of so-called poison rye grass also called poison darnel, and these frequently in large numbers. In one sample one-half of the seed, by count, were of this weed. This grass, poison darnel, is our California chess or cheat. A Brome grass is the chess or cheat of the eastern and northern states. There has been a popular fallacy that wheat turns to cheat—even some seedsmen believe it now. These grasses spring only from their own seeds. When chess seeds of strong vitality are present with small shriveled wheat, is it any wonder that the wheat field is over-run with this pest, which is a very hardy plant?

A few years ago in a district south of here there was considerable trouble experienced in raising oats. A sample of the seed used was sent to Prof. Hilgard with a letter explaining that repeatedly in that vicinity oats had been planted from which a crop of barley was raised. And an appeal was made for an explanation of this freak or mystery of nature. Upon testing this sample I found that it contained 80 per cent of small oat seeds, 85 per cent of which would germinate under most favorable conditions, but the seedlings were not strong; 18 per cent of the sample consisted of good plump barley seeds, 98 per cent of which would germinate, showing a vigorous growth; 2 per cent of the sample was of poison darnel, chess of cheat.

Please do not believe that wheat can turn to cheat or oats can turn to barley.

It has been said that in a broad sense any troublesome plant may be called a weed. Bad or noxious weeds are any kind of bindweeds, as morning-glory, which is more feared by farmers than any other weed, whether or not it is the worst one we have; parasitic vines, as dodder or love-vine, which causes so much havoc in clover and alfalfa fields and in flax fields in the old world, which twines its yellow leafless stems around the plant from which it takes its nourishment, surely weakening the plant, if not taking its life—the utmost precaution should be taken not to introduce it.

Plants with creeping root stocks, as Johnson grass, Bermuda grass and Poverty weed are very objectionable, for once in the ground it is almost, if not quite, impossible to eradicate them.

Squirrel tail and fox tail grasses may prove very troublesome.

Also any spiny or prickly plant, as the common spike weed of the lower San Joaquin Valley, and prickly lettuce, and any plant which bears many seeds and is of no use for forage.

It is not unusual for me to find from 100 to 500 weed seeds in about one teacupful or one-third of a pound of Alfalfa seed. These samples frequently contain from 10 to 20 different species of weed seeds—often some may be screened out by means of a properly selected sieve. One of the species of dodder seed frequently found in alfalfa seed can not be cleaned out. Alfalfa seed which contains any dodder seed should never be planted. Utah alfalfa seed may be excellent as regards germination, but we want to know which of Utah's weed seeds we are importing.

From the kind of weed seeds present I can frequently tell whether the seed before me is Utah or California grown. In about one-third of a pound of alfalfa seed I found the other day just one seed of so-called Russian thistle, also called Russian Cactus, but better called Russian Tumbleweed. Introduced with flax into the middle west some twenty-five years ago, it proved a fearful pest. It is said that one plant may bear from 20,000 to 30,000 seeds which are scattered as the plant is blown, rolling and tumbling over the country, or the seeds owing to a winglike attachment may themselves be carried by the wind.

Is there not economy in having seed tested before planting? Frequently, whether there were many or few weed seeds present, I have been able to tell the farmer that it was possible to clean out all of the bad weed seeds.

On rendering my report I always explain the character of the objectionable weeds represented by the foreign seeds in the sample.

One man said recently that he spent $70.00 this last summer in attempting to destroy morning-glory.

I would like to know what some of this audience could tell of destruction of crops, land rendered useless, and money lost from the presence of weeds.

Scene above Ukiah on the Line of the California Northwestern Railway.

Deciduous Fruit Culture

BY J. W. MILLS, POMONA, CAL.

PEDIGREED TREES

The time was when 90 per cent of the growers would plant orange trees and be satisfied with no other guarantee than that they were Washington navels or Valencias. That time should be past for every prospective planter. A striking example has just been presented to us by a non-resident orange grower who has a grove at Upland. The owner has written to the Experiment station to have the grove examined and ascertain if possible the reason why the trees have failed to bear satisfactory crops. The grove is in charge of a thoroughly competent man and the best care has been given it. The trees are thrifty, bloom full, but set little fruit. The general shape of the trees suggested at once that they were not a good type of Washington Navel, but had the appearance of Australian navels, though the fruit was distinctly of the Washington type. The history of the trees was not known, they having been shipped in from another district. This orchard has been cared for as well as could be, fertilized, irrigated, cultivated and fumigated, but the returns have been discouraging. A few trees seattered here and there are of the true Washington Navel type and are loaded with fruit. A few trees have been budded over to a good strain and are bearing large crops of fine fruit. We never have seen a more striking example of the folly of buying and planting any kind of a tree that was offered. Some time ago, there appeared an advertisement in the Cultivator for Pedigreed Valencia nursery trees. This man was an up-to-date citrus grower and well known in Southern California as a careful man in business affairs. It is safe to say that had all the citrus growers of California used this precaution the grade of California oranges would be several per cent higher than it now is.

Several articles on the importance of pedigreed nursery stock have appeared in this paper. There is no branch in horticulture which has an exception to this important principle. It applies to all living things and it does not show a close attention to details when a person will accept any kind of stock or will object to paying more for stock which is known to be derived from tested parentage. The idea of caring for an orchard for years and have it produce ten or twenty per cent less than it would had a proper selection of trees been made, is no worse than a merchant locating in a poor business section because the rents are cheaper. The merchant can change his location in a day, but the grower has his business rooted deeply in the soil.

There should be a law compelling every nurseryman to keep a history of the source of his stock with a penalty attached should he sell without it.

WALNUT AND GRAPE PROBLEMS

Editor Cultivator—Can you tell me if it is necessary to cut the tap roots of young walnut trees in order for them to bear? Can you plant the nut and cut the root still leaving the tree in the place where it grew? Also can you tell me any special kind of table grape that will bear well on this coast? Any information will be greatly appreciated. C. E. K., San Luis Obispo.

It is not necessary to cut the tap roots of walnut trees to make them bear. Plant budded trees or graft over trees that do not bear and you will have the problem solved. We would judge from your question that your trees are seedlings.

There are so many varieties of table grapes that bear well on the coast that we hardly know which to recommend to you. A good collection for the family vineyard would be Cinsaut, Blue Portuguese, Napoleon, Verdal, Bowood Muscat, Golden Queen and Clivette de Cadinet.

TRANSPLANTING AND SPRAYING PEACH TREES.

Editor Cultivator—Would you kindly inform me in your next issue as to how low you would cut down two-year-old peach trees just transplanted and it is advisable to spray peach trees now when buds are all just beginning to break open. What solution would you use? salt, lime and sulphur or salt, lime and bluestone? R. B. Reedley.

We would cut two-year-old peach trees just transplanted, back so there would be about four buds of last year's growth left.

It will not hurt your trees to spray with the lime, salt and sulphur. wash even when a few of the fruit buds are beginning to open. It will, however, destroy the blooms when they are open. The lime, salt and sulphur wash with one pound of bluestone to every ten gallons of water will be effectual for bugs, worms and fungus.

PEACHES IN SOUTHERN CALIFORNIA

Recent arrivals are coming at us with the question of planting peaches in Southern California for the markets and canneries. This subject has been thrashed out several times, but it is dollars in the pockets of the tenderfeet and they are our good friends, to know the weak spots in our fair land. Southern California has a weak spot in her peach belt. With the exception of some of the southern varieties and the Salway and perhaps one or two other northern varieties, peaches are uncertain and generally unprofitable in the south. The trouble is due to the freaks in our climate. We usually have a warm spell of weather in February that starts the sap to running and later on we have some cold weather that gets them out of the notion of growing. This element in our climate does not suit our peaches and they are so affected by it that they often fail to even leaf out in the tops. It is quite common for them to drag along in their blooming until July. The result is that most of the bloom drops before it sets fruit and in some years most of the blossom buds fail to open. This is why we cannot show big returns from our peach orchards.

Lewkins Honey, Belle of Georgia, Angle, Triana and some of the other southern varieties always have a crop with us. Henrietta is a yellow cling that gets through all right and Salway is a yellow freestone that does the same.

PLOWING ..UNDER ..GREEN CROPS

It is not safe to delay plowing under green crops much longer. The fiber of the plants will rapidly toughen from now on and the more fiber the plant contains, the more moisture and the longer time will it take to decompose it. It should all be disintegrated before the summer weather comes on or a great deal of the benefit will be lost. A heavy growth that lies near the surface causes the soil to dry out and besides it is always interferring with the cultivation. A large part of the benefit that would be derived from it during the coming year will be laid over if not entirely lost, for that which the cultivator drags out is usually bunched and burned or carried off the land to get rid of it. A good method is to disc the peas before plowing. This cuts them in small pieces which prevents their bunching at plowing time. The disc alone is supposed to do both jobs at once, but where the peas are very heavy they will even bunch up with this machine.

GRAFTING PEACH TREES

Editor Cultivator—As I have never seen how trees are grafted, will you please write in your paper how I can graft three or four-year-old nectarine trees to Muir peaches and when? Del Rey.

This question is fully answered in the March 2nd number of the Cultivator on Page 196.

PEACHES, PLUMS AND PEARS

Editor Cultivator—Will you kindly tell me through your paper the names of some of the best varieties of peaches? Especially tell me how the Carmen, Guinn and Hawk are, also how the Barry pear and Abundance Plum rank among their kind. Subscriber, Ventura.

Carmen is not much of a peach, and we are not acquainted with the other two which you mention. Barry is a good variety of pear. Abundance is a fairly good plum, but not so good as some other varieties.

A few of the best varieties of peaches are Large Early York, Belle of Georgia, Lewkins Honey and Cooleges Favorite. These are freestones for table use, and are some of the best in a collection of a hundred or more varieties.

Plant Loganberries

For profit. We are prepared to purchase the fruit and, in fact, all kinds of small fruits, even if too ripe for other uses. If you have

BY PROF. A. J. COOK

MILLET OR SWEET CLOVER

There is no single family of plants that play so large a part in honey production as the clover or legume family Leguminosae, so named, because the fruit is a legume or pod, as best typified in the peas and beans. Here we have the locust, the mesquite, so famous for honey in most arid parts of our own State and in Arizona; beans which often give a beautiful yield of nectar in the fields of Ventura county; and most important of all the several clovers, the white clover that incomparable honey plant of all the East producing as it does, honey as delicious as any known. And so wide in its distribution, and so excellent as a lawn plant, the red clover of little value for black bees, because of its long flower tubes, pouring out its nectar beyond the reach of their short tongues, though giving to Italian bees often no inconsiderable portion of their large product; the alfalfa, which in the San Joaquin valley, Nevada, Utah and Colorado, is oftimes the almost total dependence for the great honey harvests of those regions; and last of all our subject for today: melilotus, or sweet clover.

The two varieties of sweet clover, yellow and the far more common, white, are both superb honey plants, which were they as extensively grown would be close rivals of the white clover in value and importance to the American bee keepers. The honey that we get from sweet clover, as we would judge from the exquisite perfume which is exhaled by the plants when in blossom, is fully equal in appearance, flavor and quantity produced, to the justly prized white clover honey or to that from alfalfa.

There is, however, one serious drawback to sweet clover. It does not take high rank as a useful forage plant either for hay or pasture. I grew this among my experimental plants for honey for a long series of years at the Michigan Agricultural College, and while the beauty of the plants pleased me greatly by their vigor and beautiful green, yet I could never coax my cow or horse to show any preference or even liking for them. They were so uniformly excellent for honey that I tried over and over to get my horse and cow to show a taste for them, but always in vain. I am aware that many people in widely separate sections of our country praise them for both hay and pasture; yet from my own experience and observation, as also from the fact that they have never gained any prominence in this respect any where throughout the country so far as I am aware, make me very fearful that bee keepers who hope that these sweet clovers will never enter prominently into the field of forage plants reckon without their host. I am further confirmed in this opinion from the fact that both in California and Michigan I have seen them n pasture fields, left undisturbed by horses and cattle alike, while the grasses and other clovers were closely cropped. I wish I were wrong in this, for I would like to see sweet clover as useful and valuable as a feed, as it is for honey, yet I feel very confident that our farmers will never grow this plant for feed. When they can get alfalfa red clover, or alsike. This latter is by the way, of rare excellence as a honey plant, as well as for hay and pasture. There is, however, one use for sweet clover that may well be considered. I refer to road side planting, and for planting in waste places. There is much yellow sweet clover along the irrigating ditches in Caifornia, and it is extensively grown along the highways in sections of Illinois and other states. Every bee keeper should see to it that abundant honey plants fill all waste ground about his bee yard. Aong the railroads is often a goodly area that can be thus utilized. Bee keepers are wise who keep seed of such plants as the mints, cat-nip, motherwort, etc, even in their pockets, to be scattered when and where they will grow, to add to his profits and in such cases the sweet clovers may well claim attention. Let us remember, however, that it is well demonstrated that it will never pay to cultivate on good land plants exclusively for honey.

LIMING THE SOIL

An article by an eminent European authority reviews quite fully recent investigations, including those of the author and his associates, on the use of lime as a fertilizer, concluding that the results confirm the author's well-known views regarding the necessity of maintaining a definte relation between lime and magnesia in the soil in order to insure the highest productiveness. It is also necessary that neither lime nor magnesia should fall below a certain limit. For this reason it is urged that in soil analysis determinations should always be made of the megnesia as well as of the lime.

DOUBLE BAGGED COW

Will a cow with two bags, one beneath her body and the other on top, give twice as much milk as an ordinary cow with only a single outfit? This is the question before Ben Robbins of No. 247 West Thirtieth street. He has one of these fully equipped new-style cows.

The animal, now 8 months old, is a fine Jersey, perfectly formed and healthy, except that it carries a second bag with four udders on its back. This bag is a duplication of the one in the regulation place under the body. The bag on the back forms the end of a fleshy growth about a foot long, of oval cross-section, and about six inches in diameter, which grows out just forward of the root of the tail.

The calf was deformed in this peculiar way when born, and yet it has been very healthy, having grown and developed rapidly. Men who have had years of experience with cattle say this is the queerest and most wonderful freak they have seen, and they are watching the development of the animal with great interest.—Los Angeles Times.

PIONEERING.

There is an unexplainable essence and substance to pioneer efforts—a something in youth that is richest and dearest of all. In later times our efforts may be more finished, there may be even more to boast of, but a quality is gone, a something is lacking that we know and realize but cannot explain.

"There are gains for all our losses,
  There is a balm for all our pain
Yet when youth the dream departs
It takes something from our hearts,
  And it never comes again."

The difficulties which beset men in the beginning of things, tends mightily to the building of character. Strong men are the natural product of pioneer efforts. These struggles bring out qualities and round out character as nothing else can.

TREES

ROEDING TRUE TREES FRESNO, CAL.

True to Name

It is of the utmost importance that young trees, shrubs and vines for planting be true to name. They must also be well rooted and properly prepared for shipping and planting.

We have four separate nurseries, comprising over eleven hundred acres, in different sections of the country, each having its peculiar soil best suited to the special requirements of different trees, shrubs and vines for their perfect development. It is a costly method for us to pursue, but it enables us to grow the very best on the market.

CALIMYRNA FIGS

Over fourteen years of careful experimenting with the growth of the Smyrna fig, or fig of commence, in this country were required before we could say that we had been entirely successful in propagating this valuable fig, and for the past five years we have been growing this fig in its perfection, drying, packing and marketing it.

CALIMYRNA R FRESNO

There are several varieties of the Smyrna fig, but with our varied experience in this line we feel warranted in recommending one, the Calimyrna, as the most profitable and best for all commercial purposes. We are able to supply almost any desired quantity of these superior trees.

We protect the Calimyrna Fig with the seal shown herewith, which is attached to each bundle of ten trees.

We have this season a superior stock of

PEACHES, PLUMS,
PRUNES, PEARS,
APPLES, APRICOTS,
CHERRIES, OLIVES,
NECTARINES, ETC.

These trees are all grown in our nursery plant, No. 3, which has a rich river bottom soil, permitting the most perfect rooting. Our

ORANGES,
LEMONS,
POMELOS,
LIMES,
CITRON

And all of our citrus fruit trees are grown in our nursery at Exeter, which has a deep, rich, black loam and is particularly suited to citrus trees. All of the standard varieties will be found in our stock.

GRAPE VINES

As we are the largest growers on the coast of the best varieties of raisin, wine and table grapes and also make a specialty of vines grafted on phylloxera resistant roots, we are in a position to fill your orders most satisfactorily.

CATALOGUE FREE

Our catalogue, in either English or Spanish, is profusely illustrated and gives a good idea of the immensity of our stock. We mail it free to any address on receipt of 6c postage. Price list mailed on application.

BOOK YOUR ORDERS NOW

If you are contemplating doing any planting it would be well for you to place your order as early as possible. We will book your order now and ship your stock when it is desired.

THE NURSERYMAN'S SIDE

Editor Cultivator—I was very much interested in what Mr. Geo. C. Roeding had to say last fall in regard to nursery stock and the general inspection laws of the State. It would seem that a further discussion, open and honest, would be very beneficial The general impresson seems to be that the nurseryman's business must, of necessity, be illegitimate and he an outlaw and a pirate, and therefore lawful prey to be despoiled of his property without regard to equity or scientific facts; that is, without regard to the "square deal."

I was in the Baldwin Ranch country near El Monte, last week and found lots of walnut planting under way. One man told me that after his trees were planted an inspector came around. The inspector was going to have them taken up and destroyed, but the man objected. He told the inspector that there were thousands of walnut trees all around him that had been planted from one to probably twenty or thirty years that were infected with the bilght, and, unless these were dug up and destroyed it was useless for him to dig up and destroy; the only difference being that his had been planted a week or two while the others had been planted longer. The inspector told him that it was the intention in Los Angeles county to dig up and destroy every tree found to be infected in the county. However, the inspector took the matter under advisement. The planter told me that he had some not yet planted, and that the inspector would probably condemn part of these—not because they were worse than those planted, nor the thousands that had been planted for years,—but because they were not planted. The planter seemed to think that the destruction of these trees would be alright if the nurseryman had to stand the loss, but that it was all wrong if he had to stand it. The trees were a fine lot and, I found, had been furnished by a neighbor of mine.

Some years ago members of a firm in Los Angeles county told me that it was the intention to dig up and destroy all apple trees in the county found to be infected with woolly aphis. I replied tht all bearing trees in the county would probably have to come out. They scoffed at the statement. About two years later Mr. Maskew reported that he had found about 75 per cent of the apple trees so infested in one of the supervisorial districts.

The probabilities are that every walnut tree in Los Angeles county is infected with the walnut blight. Assuming that the trees infected were dug up and burned and new trees, entirely free from the disease were planted, before they came in bearing every one of them would be in fected and ready to be dug up again, and so on till the end of time. The industry would thus be annihilated by the very system and men who are supposed to nurture and protect it.

The conditions are about the same as regards the walnut blight. all over the State as in Los Angeles county. For four years in succession I have visited every important walnut section and nearly all important groves, in Southern California and know from personal observation whereof I speak. Now is it in accordance with reason, equity, or scientific facts, or the "square deal", to destroy trees infected with the blight, which belong to a nurseryman, while trees equally infected but not owned by nurserymen are not destroyed? Shall we annihilate the industry in order to rid ourselves of the blight? I say "No" to both questions. Let us deal honestly and rightly with the question.
A. A. Mills, Anaheim.

RUSH GROWING

The agricultural department of the University of California, experimenting in co-operation with the Oakland Board of Trade on the propagating of rushes on the Elmhurst marshes, has made the discovery that the tule will grow so well there that it will more than rival the matting rush hitherto imported at great expense from China and Japan. Professor Stubenrauch of the University of California made an examination of the plantation started last year on land at Elmhurst, donated for the purpose by M. J. Kerwin. He found that the juncus rush, which had been planted os the marshes, had grown remarkably, despite the discouraging conditions under which it was set out. His measurements found rushes that were from twenty-six to thirty-two inches long from root to tassel. As the Eastern manufacturers have said they could readily use rushes twenty-eight inches long, the experimenters feel that this part of the investigation has been successful. There is so much faith in the experiment that 2,000 more roots will be planted. The United States Department of Agriculture, attracted by the success of the venture in Alameda county, has ordered large shipments of the roots to be sent to North and South Carolina and Florida, to be set out on the marshes there.

BY J. W. MILLS

THE NEW YORK MARKET

The following article from a special correspondent of the Los Angeles Times, in New York City, presents a ery full and fair reflection of the conditions confronting California's cit-s fruits in the larger markets of e Eastern United States.

"With a little touch of winter dur-g the past week, which ended up in , sixty-mile gale, the orange trade as suffered more or less severely, depending upon circumtsances. Retailers have had difficulty in keeping up their end of the business so far as New York itself has been concerned and sales have been more or less slow. Toward the close of the week it got spring weather again and there was another boom in sales. It is indeed difficult to keep track of the market under such unsettled conditions of weather.

It is noticeable, however, that, notwithstanding the unsatisfactory weather conditions, wholesalers bought as heavily as usual and there has been a fair auction business throughout. The market from first hands has suffered comparatively little, the greatest reduction being about 10 cents per box. But that was speedily regained and prices now are as high as they have been for the past few weeks.

The condition of the market, as it is now, is quite satisfactory for the season. There has been a good demand continuously, even though Floridas have hung on longer than was expected at the beginning of the season and longer than appeared possible from the reports of the probable yield. But there are less of them now than there were in February and a good many of those offered are taken by a special trade and the competition doesn't really affect the market for Californias. Under such conditions the outlook is considered good and most buyers and dealers are looking forward to rapidly increasing movement as the spring advances.

A leading dealer was speaking of certain trade tendencies this spring which seem more marked than usual. For example, there are more inquiries for Californias from outside towns and cities than usual at this season of the year. The market there appears to be improving, partly because the California is better known and partly because there is something about the appearance of the California which commands attention once dealers have seen it. The sale steadily increases wherever it is introduced. It is a fact, that, notwithstanding the large and constantly increasing distribution there are many dealers in the interior who never handle a California orange and do not understand the profit it yields as compared with the Florida from the single fact alone that it does not spoil as quickly.

There is every reason to believe that if these small dealers in interior towns were canvassed and came to understand the value of the California as a means for money making, partly by reason of its more active sales and partly because there is less waste, that they would buy more freely than they do now. It has been suggested that some missionary work of that character be done this season, and possibly it will be. It is reasonably certain that if this kind of missionary work is done there will be big returns from the effort and the money invested in such a move.

All varieties of oranges excepting Californias have disappeared from most of the street stands. This is representative of the city trade. If there are plenty of Californias these street dealers will take them in preference to the others because they will keep better and there will be less loss upon those which are not sold out at the close of each day. As a rule a box of Californias will keep reasonably sound for three or four days at this season of the year and by picking out those which appear ripest, and disposing of them the first day it doesn't make so much difference if the others are unsold at night. The loss will be comparatively small.

Any other kind of orange will show a greater proportionate loss and there will be sufficient in numerous instances perhaps a majority of instances, to greatly reduce the price. The market will not always absorb everything offered though the street sellers understand their market pretty well and seldom get caught. They more often clean up everything they have than not and can carry home their profits in their pockets at night. The loss is so trifling that it doesn't count with many of them.

One thing is astonishing, the steadily increasing numbers of street peddlers. The market appears to be limitless and there are more and more entering the field every year. Nevertheless the increase in population in and about New York and the steadily increasing consumption by each individual makes the market sufficient so far to absorb the offerings of most of these dealers. They suffer from the competition of wagon men more than any other single cause and would be glad to see the wagon men out of business. This competition cuts into the residence districts more than it does anywhere else. There are many men who travel through the residence districts of the city who are never seen in the business portions. Those parts are given over to the street stand and the push-cart man.

The methods of the wagon men are not always what they might be. Possibly one might say that they are not always what they should be. They buy inferior grades of fruit and hawk them through the residence portion of the cities at so many for a quarter or some other small sum of money. The oranges are quite likely to be sour, now and then one is specked and otherwise more or less poor, depending upon circumstances. They give buyers a wrong impression of California oranges and many residents are prevented from buying after the first experiment because they are convinced from the examples they have seen that California oranges are not what they are supposed to be. While the practice is reprehensible it cannot be stopped. It is one of the evils to which all business enterprises must pay tribute more or less and there is no means of preventing the injury which it causes to a legitimate business.

Of course shippers can assist greatly in stopping it, or shall we say that shippers can do much toward reducing this practice by refusing to send forward inferior fruit? If it isn't here the hucksters cannot get it and will be compelled by force of circumstances to buy the best and sell it at good prices. In this way the industry, as a whole, would benefit and there would be less complaint about the inferiority of California fruit.

Lemons have advanced sharply and are now higher than they have been for some weeks. Sales are more active and there is a better feeling in the market. It seems probable that this improved condition will continue and that the future will be of more importance than the past. The market is now in reasonably good condition, with supplies light and demand increasing. Importers are moving with caution and are making their receipts as light as they can possibly be.

The California market is good and sales are steadily increasing, The price holds up under a steady demand from all directions and there is a good deal of promise in the situation, as a whole. The principal difficulty is the small quantity of Californias coming forward. The market would easily absorb considerably more.

FERTILIZERS · FOR · THE · LAND'S · SAKE · A·C·W·

FERTILIZERS

More commercial fertilizers have been used this season than ever before in the history of the business in California. Why? Many growers owing to poor prices for fruit during the past two years discontinued the use of fertilizers trying to save expense—poor judgment. This year prices rule better than at any time in the past five years. The good business man figured on this and kept his grove up with fertilizers—**he** has the **crop**—he has the money in bank and his grove is in good condition to continue to produce, the other fellow's grove is "run down', and no crop and it will take **two years** to put in first class shape again—loss of time, loss of crop and **money.**

We are working overtime and have been for 30 days, but can handle your business. See our Agent in your district for the **crop producing A. C. W.** Fertilizers.

ORANGE TREES

Oldest Established Citrus Nursery in California, at Alhambra, Los Angeles County

Late Valencia and Washington Navels, Lisbon and Eureka Lemons. Guaranteed true to name. No better trees in this State. Lowest market price. Three-year buds, four-year roots. Horticultural Commissioner's certificate. Order early, as good trees are scarce. Inspection invited.

E. G. Wood, Owner, at Nursery or Room 732 Huntington Building, Los Ange'es, Cal.

The Ornamental Garden

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

RURAL HOUSE GROUNDS

One's training for the work of life is begun in the home and fostered in the school. This training is the result of a direct and conscious effort on the part of the parent and teacher, combined with the indirect result of the surroundings in which the child is placed. The surroundings are more potent than we think; and they are usually neglected. It is probable that the antipathy to farm life is formed before the child is able to reason on the subject. An attractive play-ground will do more than a profitable wheat crop to keep the child on the farm.

Bare, harsh, cheerless, immodest,—these are the facts about the average rural school ground.

Children cannot be forced to like the school. They like it only when it is worth liking. And when they like it, they learn. The fanciest school apparatus will not atone for a charmless school ground. A child should not be blamed for playing truant if he is sent to school in a graveyard.

It would seem that land is very precious. Very little of it can be afforded for a school ground. A quarter of an acre of good land will raise four bushels of wheat, and this wheat may be worth three or four dollars a year. We cannot afford to devote such valuable property to children. We can find a bit of swamp, or a sand hill, or a treeless waste. The first district school I taught was on a heartless hillside. The premises had two or three disconsolate oaks, and an old barrel was stuck in the top of one of them. The second school I taught was on an island in a swamp. The mosquitoes loved it.

The school building is generally little more than a large box. It has not even the charm of proper proportions. A different shape, with the same cost, might have made an attractive building. Even a little attention to design might make a great difference in the looks of a schoolhouse; and the mere looks of a school house has a wonderful influence on the child. The railroad corporation likes to build good-looking station-houses, although the-- have no greater capacity than homely ones.

The following sentences are extracted from the "Report of the Committee of Twelve on Rural Schools," of the National Educational Association (1807).

"The rural schoolhouse, generally speaking, in its character and surroundings is depressing and degrading. There is nothing about it calculated to cultivate a taste for the beautiful in art or nature."

"If children are daily surrounded by those influences that elevate them, that makes them clean and well-ordered, that make them love flowers, and pictures, and proper decorations. they at last reach that degree of culture where nothing else will please them. When they grow up and have homes of their own, they must have them clean, neat, bright with pictures, and fringed with shade trees and flowers, for they have been brought up to be happy in no other environment."

"The rural schoolhouse should be built in accordance with the laws of sanitation and modern civilization. It never will be until the State, speaking through the Supervisor, compels it as a prerequisite for receiving a share of the public funds."—L. H. Bailey.

The Riverside Press states that E. T. Allen, State Forester, is in Riverside conferring with representatives of the local water companies and some of the directors of the Chamber of Commerce. Mr. Allen is seeking to interest the various counties of the state in the matter of fire protection for the foothill and mountain territory outside the government reserves. The state law permits the counties to make appropriations for this purpose and thus provide for efficient co-operation with the forest rangers employed on the reserves.

THE "BLACK WATTLE" INDUSTRY

The "Black Wattle" Acacia is extensively grown in California as an ornamental, and it may interest some of our readers to know what a profitable crop it has proven in lands where soil and climatic conditions are somewhat similar to ours.

In Hawaii, in connection with the Tantalus forest there were planted some twelve or thirteen years ago a lot of six acres of this tree. The location was a rocky one with poor and shallow soil. The grove was included in the portion of the area set apart for the Federal Experiment Station. As the trees were not in a healthy condition Mr. Jared Smith, the superintendent of the Experiment Station, caused them to be cut this last spring, the bark removed and sold for tanning material and the wood sold. Careful statistics were kept by him of the results obtained from this small area. By his kindness I am able to present such results to this Association, which are as follows:

The six acres yielded 38 tons of tanbark, 2 tons of which were used as samples and given to tanneries.

Thirty-six tons were sold at $23.[illegible] per ton realizing a total amount of $839.44.

The six acres yielded 500 first-class fence posts which were used upon the station. These posts, if purchased, would have cost 25 cents apiece, making the value received from posts $125.

In addition to the fence posts there was realized 88 cords of fire-wood which was sold at an average of $7.83 per cord, producing a total of $689.25.

Allowing the same price for the two tons of bark given away there would be an additional value of $46.62.

A summary of the amount produced by these six acres of Black Wattle is then as follows:

36 tons of bark sold........	$ 839.44
2 tons of bark given away	46.62
500 posts	125.00
88 cords of wood	689.25
Making a total of	$1700.31

or equivalent to $283.38 per acre.

As stated above the soil on which this grove was planted was rocky, thin and poor and the trees scrubby.

In South Africa the Black Wattle industry of Natal. although only twenty years old, has become one of the most important in South Africa, and exports of bark during 1904 were valued at $350,000. There are at present over 30,000 acres planted. T. R. Sim, conservator of forests in Natal states that there is no other forest tree capable of extensive cultivation which yields a return in so short a time. Complete felling may take place at any period after five years of age, although ten years is nearer the average age at which the trees are cut. The average yield amounts to five tons per acre of dry bark and thirty cords of dried timber. The bark when dry is chopped, shredded or ground and bagged in three bushel sacks, weighing when full, about 184 pounds. At Dalton, which is one of the principal centers of wattle production, the price paid for dried bundled bark ranges from $30.00 to $32.00 per ton, and for bark that had been ground and bagged, $35.00 to $37.50. It costs $1.50 per ton freight from the interior to Durban, the shipping port, and $5.00 per ton from there to Europe. The wood is sold for fuel at from $1.25 to $5.00 per cord, while heavy mine timbers bring about double that price.

PUDDLING LILY POND

Can you give us information as to the proper method of puddling with clay our lily and fish pond? State Industrial School, Ione.

Secure the best of clay, free from stones, etc., and if at all dry or lumpy it must be chopped or tamped into a consistency similar to brick earth or stiff mortar. The pond being all ready for the operation, proper depth and flaring sides, commence the work on the sides, laying the clay from four to six inches thick. Give the same a good pounding, and after drying off somewhat and before cracking give a second pounding, using wooden mauls or mallets. After the sides are finished, proceed with the bottom. See that all is smooth and level, and proceed as with the sides, taking a certain space and completing it until all is finished. Use boards for standing upon so as to keep a smooth surface. Pound as the work proceeds. If the pond is of large dimensions and the weather bright or drying, spray or sprinkle the clay to prevent it drying too rapidly, and thus avoid cracks. To make the clay as firm as possible, go over it again after an interval of a day or two and pound again, then cover the bottom with sand or fine gravel to a depth of four or six inches. The sides should be covered with sandy soil and overlaid with sods to prevent washing by the action of the wind and water. Unless clay can be had for the hauling, a cheaper and better method would be to line the pond with concrete, as there is a great amount of labor involved in puddling a pond with clay.

Prof. W. M. Scott of the United States Department of Agriculture is in Vacaville engaged in the campaign now being waged against pear blight.

EASTER LILY FOR EASTER SUNDAY

In the Vegetable Garden

BY ERNEST BRAUNTON

LETTUCE

Lettuce is a universal favorite, but few who are acquainted with the Chinese method of culture are willing to risk its use. But as there is no excuse for any one with a piece of ground five feet square, or for that matter, a box of soil, from having a continuous succession of crisp fresh lettuce, no one need be deprived of this refreshing vegetable. The secret of growing tender and sweet lettuce is to force it into rapid growth, a rich loam, well drained and kept mellow by frequent stirring, and possibly protection from a too fierce sun are the main requirements.

EGG PLANT

A few egg plants should find a place n every home-garden; they are exceptionally easily grown and when well-prepared are liked by almost everyone. While classed as a tender plant in some sections they thrive throughout the year when once well established. It is not exacting in soil conditions, and resists hot dry weather well. To produce large tender fruts, the soil should be well enriched and if cut back occasionaly they will continue to bear for a long time.

There are practically only three varieties, as follows: New York Imperial Large Purple, Black Pekin, and Georgian Pearl, the latter an attractive white variety.

CUCUMBER CULTURE

Cucumbers like heat but cannot endure drought. A light mellow soil is best, though good crops are frequently grown on heavy soils so long as they are not permitted to bake and crack. Plow deeply and thoroughly. Mark out the ground five feet apart each way and at the intersection incorporate a large shovelful of well rotted farm-compost. In the hills thus formed sow eight or twelve seeds which will allow for half being detroyed by insects. When the plants begin to send out runners thin to the best three or four plants remaining. Keep the ground well cultivated and free from weeds.

A good preventative from insect injury is to dust the plants with Buhach, hellebore. or tobacco dust, especially on the under side of the leaves. For a few plants it is worth while to protect the fruits with mosquito netting. The planting of radish or turnip seeds with the cucumbers has been recommended as some insects will attack these in preference to the main crop.

Frequent gathering of the fruits as they attain a satisfactory size tends to lengthen the bearing season of the plants, and permitting the fruits to ripen on the vine is certain to cut the season short.

TANNIC ACID FROM EUCALYPTUS

In a comparison between mallet bark, (Eucalyptus occidentalis) and black wattle, (Acacia mollissima), mallet bark contained 39.35 per cent o tannin matter, while black wattle contained but 35.96 per cent. The mallet eucalypt appears to be at home in the southwest of Capc Colony, where extensive experiments are under way. A table is given in a south African report which shows the growth of 37 trees 2 1-2 years from seed. The height varies from 2 to 11 feet and the average is 6 feet 6 inches. The soil on which these mallet eucalypts are growing is declared to be too poor for most agricultural purposes.

NITROGEN BACTERIA ON LEGUMES.

Editor Cultivator: In your valuable paper of the issue of February 23, in an article on page 179 signed by H. O. Sorkness, entitled "Plowing Under Peas," he raises the question as to whether or not the nitrogen in leguminous plants nodules are not lost, to a certain extent by being exposed to the air. If he will refer to Bulletin No. 72, Part 4, U. S. Department of Agriculture, he will find the statement on Page 4 that these nodules do not contain the nitrogen itself, but that the bacteria in the nodules make the plant susceptible of drawing the free nitrogen from the air.

As there seems to be considerable misunderstanding on the subject it might be well to mention it in your columns. Any leguminous plant having a good showing of nodules on the roots is constantly supplying the soil with nitrogen and the plowing under of the crop is principally valuable for the humus it affords which is very considerable.— B. F. T., Covina.

(There seems to be a widespread misunderstanding regarding the value of nitro-cultre on a much more important point than the one under controversy. It should not be assumed that these nodule-forming organisms can replace the necessary plant food, proper cultivation of soil, and other things that are regarded as necessary for growing crops. If the soil is poor the legumes will make a poor growth even if the proper germs are present and no amount of inoculation will produce crops equal to those grown on fertile soils.—Ed.)

THREE SPRAY BULLETINS.

From bulletins published in France we glean the three following extracts through the U. S. Experimental Station Record:

Notes on the use of combined fungicides.—In seeking a combined fungicide for use against the powdery and downy mildew on grapes, the author carried on experiments with a number of mixtures. and the results obtained are briefly given.

Sulphur in a dry state is said to act too slowly, and to obtain a more rapid liberation of sulphurous acid a number of mixtures were tested. Calcium bisulphite and sodium hyposulphite were each added to Bordeaux mixture at the rate of 500 gm, per hecto liter. Both mixtures badly burned the foliage and considerable injury followed their use even when diluted to a considerable extent.

Later the author tried a mixture composed of Bordeaux mixture and an alkaline polysulphid with success. The formula and directions for making this mixture are as follows: Copper sulphate, 4 kg. and water 100 liters, and lime 2 kg. and water 25 liters. After a thorough solution pour the lime water into the polysulphid solution, and this mixture in turn into the copper solution, stirring thoroughly. This mixture is said to be very effective in preventing both forms of mildew, is quite adhesive, and acts as a stimulant to the foliage, as judged from the dark green color of the plants.

A study of combined fungicides.—A favorable report is made of the addition of sulphur to Bordeaux mixture, the combination being applied at one spraying.

Three years' use of this mixture in comparison with sulphur applied in the ordinary way has convinced the writer of its efficiency. The combined fungicide is said to be much more adherent than the ordinary forms, and its greater efficiency is attributed to the fact that the sulphur is deposited much more uniformly over the foliage than is possible when dusted in the form of powder. The acid in the copper sulphate mixture is said to materially add to the adhesiveness of the mixture.

The crystalization of soda fungicides.—The chief difficulty in the use of soda fungicides is said to be due to their rapid deterioration. When solutions of carbonate of soda and copper sulphate are mixed, a colloidal precipitate of a greenish-blue color is formed. Ordinarily after standing for a little time the precipitate loses its blue color, becomes crystaline, and is less adherent to the foliage than when freshly made.

The causes of the changes were studied, and the author says that if properly made the solution should stand for a long time without crystalization. Too great acidity favors crystalization and alkalinity retards it, though too much alkali makes the fungicide thick and less adherent. High temperatures favor crystalization. The use of impure chemicals and utensils that have been used for other fungicides also favors the depreciation of the fungicide. On this account a warning is given that all utensils, spray pumps, etc., should be thoroughly washed before using them for the preparation or application of fungicides containing soda compounds.

OKRA OR GUMBO

From time to time the list of American garden crops has been increased either by the addition of one already in use in the Old World or by the improvement and domestication of our wild species. In the case of the okra the former is true, as it has been in use in the Mediterranean regions for centuries. In the Southern States it has been extensivly used for many years, but up to the present time has been cultivated to only a slight extent in the middle and northern section of this country.

Okra has no great food value, and it is not probable that it will ever become a very important crop commercially, but a few plants form a desirable addition to the vegetable garden. It is used principally for flavoring soups and preparations wherein meat forms an important part and to these it adds a very pleasant taste and mucilaginous consistency. Some persons may not enjoy the flavor of okra at first, but after eating a few times of dishes containing it a taste for it is acquired.

Alfalfa seed weighs sixty pounds to the bushel. For a hay crop sow twenty to thirty pounds of seed to the acre. For a crop of seed sow fourteen to eighteen pounds per acre: sow clean seed. Sow alone, without any nurse crop. The latter is often just as harmful as the weeds. Screen alfalfa seed before sowing, to separate the dodder and other weed seeds.

Government Ownership Suggested—The citrus growers of the Covina district to the number of 150, assembled in that city, in convention, on Saturday last, passed a set of resolutions expressing their demands for relief in the present crisis confronting the orange industry in Southern California. These representative men, of more than average intelligence, after going over at length the points of controversy in the citrus cases, decided by the Supreme Court, among other resolutions adopted the following in reference to government ownership of railroads. "We demand that Congress appoint or authorize the President to appoint, a commission to ascertain and report all the facts obtainable relating to the manner and cost of obtaining government ownership of railways now owned and operated by governments of Europe or elsewhere; the cost and efficiency of their service, including average running speed of trains, average distance of the haul of freight, and rates of charges for same; average passenger fares, and, in general, all the details which are essential to a complete and true comparison between the results under railroad management by governments and the same under private ownership."

Along the same lines were resolutions adopted last fall by the National Association of cattle growers. The fact that the Interstate Commerce Commission is not vested with authority to enforce its decisions in cases where unjust rates are established, and discriminations are made between shippers, is awakening the public to the importance of the government owning and operating the railroads of the country and the auxiliary industries connected therewith, such as the express business, telegraphs, and cars operated by private right, if relief is to come to the people before they are destroyed by the trusts and owners of the agencies through which their industries are operated. The necessity for immediate and far-reaching action by the government is becoming singularly apparent, when the insufficiency of the supposed means for obtaining redress in case of unjust taxation, arbitrary action and discrimination by railroads, and other great corporations is exposed by the the courts of the land.

Government ownership of public utilities may be one form of socialism, but if there can be found no other remedy for the evils which vast aggregations of wealth have entailed upon us; if the people cannot obtain their rights without resorting to government control of public utilities, then let that condition come. Our last end in any event will not be worse than the present. There are objections to public ownership, but there are also strong arguments to be presented in its support, one of the best of which is that it provides a "square deal" for every citizen.

* * *

Growers Must Decide—The Los Angeles Herald of Monday, the day of the orange growers' convention in Los Angeles, contained a singularly terse editorial declaraton to the orange growers of California, as to which course they shall pursue in the present dilemma in which they find themselves, by the opinion of the Supreme Court rendered in the Citrus Fruit cases, Februry 16, 1906.

The editorial referred to is as follows:

"To the orange growers who today in convention assemble: 'It is up to you."

You have it in your power now, backed by every sentiment of justice and a right cause, to demand from congress a provision in the pending railroad legislation making legal, as it is already righteous, your claim as to the routing of your own goods when you pay the freight for their haulage.

The court has said that this right is not legal. It is up to you to demand that it be made so; it is "equitable" now.

The railroads, aroused by the storm brewing of which this convention can be the forked lightning, are coming forward, bearing rich gifts of promises to be good. They know that while legally right, in equity they are wrong. They wish to retain the legality of their position.

Two courses lie before you: To stand for your rights and decide to maintain them; to send representatives to congress to enforce this demand; to make legal what is already right; to grasp forever the reins in your own hands.

Or—

To be trapped by honeyed words and blandishments; to swallow specious promises to "be good"; to lose once and forever the great chance offered you to throw off the railroad yoke and be free.

Win or lose, if you take the first course, you have won in the end. Win or lose, you can only lose if you "stick your head in the lion's mouth;" some day the jaws will snap.

Which will you do?"

* * *

Growers Organized—The representative citrus fruit growers of Southern California have organized a Citrus League which hereafter will, through an administrative committee, carry on the work of the Citrus industry in California. The committee selected for the work is made up of the following well known fruit growers: F. Q. Story, A. P. Johnson of Riverside; S. J. Beals, of Orange; George Frost, Riverside; S. P. Jennison, Covina; E. M. Lyon, Redlands; H. H. Garstin, Redlands; J. S. Edwards, Highland; G. T. Whitcomb, J. P. Dreher, F. L. Palmer, Pomona; C. C. Teague, Ventura, W. Sprott, Porterville; B. A. Woodford. Upland; W. H. Young, Duarte; E. L. Van Horn, San Bernardino; E. S. Moulton, Riverside; Elmer W. Hart, Azusa;James Fleming, Highland; W. H. Jamison, Covina, James Slauson, Azusa.

It is the avowed intention of this organization to take active and immediate means to secure the enactment of such legislation as will restore to the shipper the right of controlling the routing of his shipments to their destination.

One of the first steps in this direction will be the drafting of a memorial to be presented in Congress by the representatives from this district, urging the passage of the Hepburn bill.

* * *

Who is Responsible—A few nights since a young man was killed in a slugging match at San Francisco. It is the second case of murder, within the ring, in the past three months. The authorities at San Francisco claim they cannot stop ring fights because the law sanctions them. In Los Angeles hundreds of young men and women, too, for that matter, have come to ruin through gambling at the races. The authorities will do nothing, or can do nothing, to close up this mint of hell, apparently satisfied to see it go grinding on, carrying down to death promising men and clerks and girls who have become so infatuated with its revelry that they are unable to resist.

Who is responsible for this state of crime in California? Last winter a bill was introduced in the legislature abolishng gamblng, at fairs and race courses, but it was permitted to lie over until too late to pass. So with other bills calculated to correct the criminal morals of the degenerate public. The legislature simply failed to come to the rescue of the morally weak. More than to any other cause is the legislature to blame for the lax morals which pervade San Francisco and Los Angeles today. It is responsible for the imperfect enforcement of the law, in that a great many of the laws which have been placed upon the statute books of California either hrough ignorance or design, have been so framed as to permit of their easy evasion, have been so framed as to invite a violation of the law and put a premium on perjury.

We can never have the proper enforcement of our criminal laws so long as men in the very legislative halls of the state, while professedly representing the people and their best interests, are, as a matter of fact,—whatever may be the influences controlling them,—representing the violators of the law by providing for them an avenue by which they can escape its punishment.

There is too much playing to the galleries, while at the same time doing no substantial injury to the interests against which their legislation is supposed to be directed.

Now then, where does the blame for such conditions rest, ultimately and finally? What makes this condition possible? Who has the power to provide the remedy? The answer to this question is what concerns us, and we answer unhesitatingly, "The People."

Here is where the final responsibility for the lax condition of our laws rests, for it is the people who elect these legislators to office and who are responsible for their evil doing. If at the primaries dishonest men were relegated to the rear and honest, capable men were chosen to make our laws and to enforce them, our statute books would not be burdened with ineffective laws and our criminal courts would not be full of cases of perjury, bribery, forgery and theft. If the so-called respectable citizen would only discharge his duty to his State, recognize the existence of personal responsibility, and seek to discharge it honestly and fearlessly, we would not be up against such a condition of things as exist today in California.

The curse of this country has been and is the failure of the so-calle decent citizen to discharge his dut or recognize the existence of respons bility whch rests on him individuall and all the time by reason of the fa that he is a sovereign citizen of repu lican government. He does not see to feel any responsibility for this con dition; he has not even given the mat ter enough thought to be able to realize his strength or his power.

Until there is an awakening of the conscience and a stiffening of the public backbone to throw down dishonest candidates for office, we shall go on committing murders, filling our jails and penitentiaries with criminals, while we sit back and wonder why our laws are not enforced and why crime seems to be spreading in these days of expanding light and education.

What the people want to do is to awaken from their apathy, recognize their responsibility as citizens, and do their duty, simply and regularly, at the primaries and at the polls, then will we not banish crime, but abate it, not make men and women wholly moral; but improve their morals, and in so doing, help the future generation to advance toward a better, truer life.

FARMERS' INSTITUTES.

San Jacinto, March 20-21; Elsinore, March 22-23; El Cajon, March 27-28; Rialto, March 29-30; Covina, April 2-3, yours truly—J. B. Neff.

THE TYPES ERROR.

In the article on Kings and Tulare Counties in the March 2 issue of the Cultivator, we were made to say by the types, "Mr. Wilde told me that they have, on the Charles place, 65 cows which net them $60 each per month, outside of the skim milk he feeds his calves and hogs and above the calves produced."

The sentence should have read "65 cows which net them $6.00 per month. This, with the calves and skim milk, ought to bring the earning capacity of each cow about $65 per year.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

Watsonville apples captured the next State convention of the Y. M. C. A.

A grape juice factory is being planned for Rochester, San Bernardino county.

The Vacaville Reporter says fruit prospects are looking very well in that vicinity with the exception of apricots. This crop will be almost a total failure.

It is estimated that 500,000 vines were planted this year within ten miles of Ukiah. The Asti Colony people have furnished 250,000 cuttings free to the vineyardists.

The Earl Fruit Company sent out its first carload of late oranges from Oroville last week. From this time on, about two carloads a day will be shipped.

Orange growers as a rule are opposed to the practice of selling cull oranges to peddlers or the cheaper class of boarding houses on the ground that it injures the sale of the good fruit.

Prof. Bioletti of the University of California has made arrangements at Woodland to plant between forty and fifty imported grape vine roots from France for the purpose of testing their practical value in California soil.

The manager of the Marysville cannery states that all indications are favorable for a very heavy yield in the orchards this season. Peaches are especially promising, and almonds and other fruits look well.

Charles Lukens was in town from Oak Glen Saturday with the last apples from his orchard. The prices received were the largest of the year, being at the rate of $80 a ton, or four cents a pound. This year there was grown at Oak Glen and in that immediate vicinity about 500 tons of apples. For all the fruit marketed there has been but little, if any, sold for less than $50 a ton, and the average price will probably aggregate $60 a ton, making a total of about $30,000 received for the fruit this season.—Redlands Review.

AGRICULTURE.

A sack of Ventura county lima beans has been sent to the King of Italy.

It is safe to say that fully 50,000 acres in this valley will be planted to beans.—Oxnard Courier.

Escondido is to have an arbor day. Her streets are to be lined with trees that will transform the old roads into delightful avenues.

A $20,000 packing plant is assured for Huntington Beach by an incorporation which has just been organized for that purpose.

Manager J. A. Driffill of the sugar factory informs the Courier that they already have contracts for the growing of 14,000 acres of sugar beets, with sufficient acreage in view to swell the total to 18,000 acres.

County Superintendent Hyatt of Riverside, has received from a former principal of the city schools a potted oak tree from an acorn from the giant Mariposa oak under which General Fremont had his headquarters for some time.

The Los Alamitos sugar factory management reports contacts now signed for over 6000 acres of beets. This promises to be the greatest year for beet growing in the history of Southern California.—Chino Champion.

There is on exhibition in Modesto an alfalfa root which measures over seven feet. This tract of alfalfa was planted in April of last year and has been irrigated but once during that time. The plant itself is unusually heavy and bushy, many of the sprouts being eight inches in length at this early date in the growth.—Stockton Independent.

MISCELLANEOUS.

Hollister is about to asphalt its principal street.

The weekly Pajaronian has entered the thirty-ninth year.

The city of Santa Rosa has named a new public school the "Luther Burbank."

The highest and lowest places in the United States are in Inyo county, California.

A new street railway system with ten miles of trackage has been opened at Fresno.

San Diego people are endeavoring to secure an extension of the Salt Lake road to that city.

The Kern River Placer Mining Company has been organized with a capital of $100,000 in shares of $10 each.

A flower show is to be held at Colusa on the 24th and 25th of April in conjunction with the Driving Park race course.

Palo Alto's bond election resulted in favor of issuing bonds for improving the municipal lighting plant to the amount of $50,000.

A boy at Santa Rosa has dislocated his neck in trying to shoulder a sack of potatoes. Next time he will be more careful, if he recovers.

Vacaville, by a decisive vote, has knocked the knockers and has authorized the issuance of bonds to the amount of $25,000 for a sewer system.

In accordance with the will of the late Mrs. Sarah J. L. Loop, of Pomona, $500 has been paid into the treasury of the Fruit and Flower Mission.

Colusa and Glenn counties claim they have raised 1 per cent of the entire wheat crop of the United States in a single season. That is a wonderful record.

There will be no more road poll-tax in Yolo county. By an unanimous vote the members of the Board of Supervisors abolished the collecting of road poll-taxes in that county.

At Visalia, in the San Joaquin Valley, the Board of Trade recently concluded to build a habitation for itself on the Main street in the shape of a two story structure to cost $10.000.

Orange county hop growers at a meeting held February 14th formed a shipping pool and will consign 3000 bales to the London market, which will be shipped by Durst Brothers of Wheatland.

The rangers in charge of the forest reserves in Northeastern Shasta county are enforcing a rule which prohibits the old settlers from carrying their rifles across reserve property without the seal of the ranger.

Public Health and Sanitary Science will be made a special department of the next Summer session of the University of California, from June 25 to August4, 1906, if sufficient applications are received before April 1 to warrant the undertaking.

The latest directory of officers and Students of the University of California shows a total enrollment in the Academic Colleges of 2862 students, of which 349 are graduate and 2513 undergraduates. Officers of administration number 305.

Colusa and Glenn counties are making great efforts to secure the passage of a bill now pending before Congress regarding the diversion of water from the Sacramento River by the Central Canal and Irrigation Company for irrigation purposes.

Arizona rejoices in the action of the United States Senate in passing the Foraker and Burrows amendments to the Statehood Bill. Only a very small coterie, numbering perhaps 5 per cent of the people, hoped to see the jointure of Arizona and New Mexico.

While working along the bank of the Alamo River, Thomas O'Brien was astonished to find hidden under a crumbling bank a number of ingots which proved to be of gold. The weight of the lot was sixty pounds and the estimated value is said to be in the neighborhood of $10,000.

The largest real estate deal ever made in California was the purchase of the Fairmount hotel in San Francisco from Miss Herman Oelrichs by Herbert E. Law and Dr. Hartland Law. The deal involved $6,000,000. The new owners propose to make the Fairmount the finest hotel in the world.

Saturday of last week a whole trainload of hops left Wheatland for Galveston to be shipped to New York by water, and thence to London. The train consisted of nine cars and carried 2654 bales of the average weight of 190 pounds, or a total weight of 694,260 pounds. At the present market price the hops are worth about $69,426, but last year they would have brought $208,278.

Special rates have been agreed upon by the railroads to the University of California Summer session, which begins June twenty-fifth and ends August fourth in connection with the National Educational Association Convention which is to be held July ninth to thirteenth in San Francisco this year. Some of the most prominent men interested in educational work in Europe and America have been secured for this session.

The bacteriology of infectious diseases will be discussed by Archibald R. Ward, Assistant Professor of Bacteriology and Director of the State Hygienic Laboratory at the Summer School at Berkeley. Students will have the opportunity of daily laboratory work in bacteriology and in the microscopical examination of specimens received at the State Hygienic Laboratory. An effort will be made to suit the laboratory work to the individual needs of individual students.

The important problems in water supply and the disposal of sewage which constantly confront physicians and public officials will be the subject of a course of lectures offered this summer at the University of California by Charles Gilman Hyde, C. E., Assistant Professor of Sanitary Engineering and recently a member of the engineering staff of the Massachusetts State Board of Health, which is charged by law with the inspection of the water systems and sewage plants of that commonwealth.

LIVE STOCK.

Anaheim has been experiencing a milk famine.

Marysville is talking of a poultry show next month.

The State Veterinarian is killing glandered horses in Sutter county, so reports say.

The Ontario Record states a movement is on foot to raise a fund to be used in the extinction of the festive coyote.

The Times says: The poultry business of Escondido affords a living for many families, the monthly output of eggs being valued at $10,000.

Thirty cars loaded with sheep were shipped on Saturday last from Red Bluff. Their destination was Los Angeles, a new market in the mutton business which has been opened to Tehama county. In the consignment there were upwards of 3500 sheep.

A pullets egg which is a rare freak is on exhibition at the Sun Drug Store It is abnormal in size, measuring 9 1-4 by 7 inches around. On breaking away the shell at one end three small yolks were removed, together with a quantity of albumen and inside was found another complete egg. of normal size, shape and form.—Riverside Enterprise.

MILKING

The professional milker in California and Colorado receives from $30 to $45 per month and board, for milking a string of thirty cows, and he does only milking—no other work. I have for a long time thought that there were few men who could milk every day, for a year, thirty cows, and do them complete justice. That there are others of the same opinion is shown in the interest taken in milking machines. The one now in working at Haywards, California, is said to be promising, though it does not do away with hand stripping, this, it is claimed, is because the cows are not as yet used to the machine, though one man seeing it at work told me that the stripping was no more than would be found left by the ordinary milkers of a herd. It amounted that evening to two pints from fifteen cows. I thought many of us would think ourselves lucky if we did not find more than that behind the milkers. The point now to be solved is the practicability of the cleaning and wearing of the machine, for if an ordinary man can run it, we gain in saving, but if it takes a hundred dollars a month-man then we are not better off than we were before.

But to return to the ordinary men milkers of today. There is a tendency to milk too quickly for good work. The quick jerky milkers make it painful to the cows and some heifers will develop into kickers. The men bet among themselves as to who will milk a cow the quickest, and some will boast that in six minutes they can milk any cow. Now while they average that, or ten ordinary cows an hour, there are cows that it will take nearly twice that long to milk. It is always the best in life that suffer, as men work with nature, to make every thing ordinary, to smooth off conditions into the usual.

I would rather a man milked twenty cows in three hours than thirty cows in that time. Count that the cows average 24 pounds of milk at a milking this time of year, this is 720 pounds of milk to be drawn in, say actual milking time of 130 minutes, about all that is left after the pails are emptied and the milker shifts from cow to cow, this certainly is too fast to do good work. Yet it is inconvenient to have the fresh cows mixed in with the ordinary ones of the herd, to make them special feeds, I find that the cows if mixed, are not always given the right amount and the strippers will often receive enough grain to make them sick, if in with fresh cows. Now the way out seems to be to milk these fresh cows three times a day and shorten the string. If the string is left the same length it will surprise you to find that the gain in milk from three milkings a day is so slight, but shorten the string and then the milk will show up, for you will be getting it all and the cows that were giving six gallons a day now rise to eight and nine and some a little more, so the average will go up to sixty-five pounds per day per cow. While it always creates dissatisfaction to cut the strings up, for when the strings have again to be increased and the cows dropped from the three times a day class, the men feel they are abused to have so long a string again. The milk produce must be largely increased if it is desired to make the increased expense of labor pay a profit.

The present wages make butter making more profitable than the production of sanitary milk. Indeed, the consumer in many places is not paying the dairyman enough, and it is only a short time until the price of mulk must go up, if the price of labor does not come down. The beef trust was broken by the people of the East by using milk and eggs when the price of beef went too high, yet the dairymen did not make fortunes, though the use of their product was increased.

When a new milker is hired, usually the dairyman is so glad to see him that the way in which he milks is not observed. I have lately had some experiences with southern white milkers. Some of them strip with two fingers and have never learned to milk with the hand, yet they have recommendations from the milkmen they have worked for. Some milk cross-handed, instead of milking the udder squarely, the two front teats and the two back teats at the same time. They claim the teats that connect with the same bag of milk in the udder are the right hind teat and the left fore teat, or the reverse. They argue that the milk is all formed and ready to be drawn at milking time. When I tell them that there is only about a tablespoonful of milk secreted the rest forming as it is drawn, they are sure it is a fable. The unwillingness to learn make these men all most useless in California. Indeed, two returned from this ranch saying that there was no work in California for men; that we wanted them to know too much for the wages; that fifteen dollars a month is better at home. I would not be surprised if that was so, for it is hard for ignorant people to change their ways. The Irish, with their ready acceptance of new things, make the best of ranch laborers. "Bob" is one of our treasures. He is a Peniel Mission boy, from Ireland, and ready to milk in the morning, run an engine at night, always with a hymn or a tune on his lips, singing away, for Bob is a joyous Christian. I wish I had a dozen men like him, clean morally and physically. The hardest task is to make men clean. My neighbor whose new bunk house is completed with fine bath room and showers, finds that the men think they are commendably clean with one bath a week. The dairyman is often hard up against it in milkers, for the cows must be milked. There is no such thing as closing down.

The milk veins must be pumped regularly twice a day. Now if the dairy inspectors would stand by the milk man, "hold up his hands," the difficulty would be lessened. If the rebukes fell on the unclean milkers, telling them they must wash their hands and clothes and that their names would be listed, so it did not matter if they resigned or not, this record would show that they had been reprimanded for dirtiness.

As it is, the milkers stand against their employers in saying they will not bother with cleanliness. A milkman who visited here some time ago told me of one of his milkers thinking it a joke, to give the inspector "[illegible]" on the habits of himself and the other milker employed. When the man found out the mischief he had done his employer he tried to retract, but was not listened to, as then the story was too tame for the papers.

The milking machine at present looks as though the dairyman's millenium is about to dawn, and may it soon come to relieve this portion of the farm life of it's worry and perplexity.

KICKING COW

A subscriber wants to know how to cure a kicking cow. Here is one rule given by the Country Gentleman:

"The habit may be cured in a very simple way, provided the milker has sufficient self-control and tact in handling animals. Taking a good short whip under the left arm, let him begin his milking as usual, and the moment the cow raises her foot to kick, give her one single cut with the whip. Never repeat this until she starts to kick again, and each time resume milking with a quet stroking with the hand and a kind word. Receiving one cut from the whip each time she raises her foot to kick, the cow quickly associates cause with effect, and gives up an action which produces a painful sting. This method is wholly ineffectual if the milker loses his temper and gives the cow several blows; equally so if he neglects to strike her with the whip when her kick does no harm.'

Chino Ranch

"THE GOAL OF . . . Ambitious Homeseekers"

The Chino Ranch is the richest water-bearing tract in Southern California. Its water supply exceeds that of Los Angeles. It is only 90 minutes from Los Angeles and the transportation facilities are unsurpassed. It is close to eager markets and has good schools, churches and fraternal orders. The soil is rich and fertile and the variety of profit-yielding products is wide.

To earnest home-seekers seeking income producing property, the Chino Ranch offers special advantages, not obtainable elsewhere for the same amount of money. Chino ranchers are acquiring comfortable fortunes with alfalfa, oranges, walnuts sugar-beets, deciduous fruits, onions and onion seed, Egyptian corn, etc. Appointments to visit the ranch under our auspices can be made at any time. Trains leave Los Angeles daily via Southern Pacific at 8:05 a. m. and 5:25 p. m.

10 Acre Lots, $75 to $200 an Acre.

POLISHING HORNS

Editor Cutivator—Please tell me how to polsh cows' horns. Mrs. F. E. S., Atwater.

Tie the cow so she will not throw her head, then take fine sand paper and rub the horns until all dirt, rings and pips are smoothed off. Follow this treatment with vaselene smeared on the horns, and well rubbed in with a soft flannel cloth. Some persons put vaselene on two or three times before sandpapering to soften the rings and make them come off easier. If the cows are old the polishing process will be slower.

BREEDING OFF HORNS

Mr. Geo. E. Stevenson, Waverly, Pa., writes the Country Gentleman:

In 1884 I bred two native muley cows to a registered Holstein bull and obtained two heifer calves without horns. I bred these two heifers again to a registered bull and obtained two heifer calves without horns. I pursued the same system of crossing back to the registered Holstein until I obtained a bull without horns and 7-8 Holstein. Then for two years I used the 7-8-blood Holstein bull on the polled females, ranging from 1-2 Holstein to 7-8 Holstein; then for two years used on the polled females a registered Holstein bull. I then used the polled bull from the last cross, bing 15-16 Holsteinfi for two years on females ranging from 1-2 to 31-32 Holstein. My last cross was from a 63-64 Holstein polled cow and a registered bull, giving me a bull calf 127-128 blood Holstein and polled.

I used this bull last season, and of six calves already dropped since November, four have been polled and two have been horned.

During all these years 90 per cent of the heifer calves from the registered Holstein bulls and polled cows have been polled and 60 per cent of the bull calves have been polled, demonstrating the truth of Darwin's proposition that "animals and plants in domestication show a tendency to discard those parts of their anatomy that are no longer necessary or useful for their protection or maintenance."

My herd now contains no animals less than 3-4-blood Holstein, and all free from horns. I believe that a few generations of breeding from the crosses I now have will permanently fix the polled characteristic."

THE MILKING MACHINE

It is estimated that over a million dollars have been expended in machinery and experimental work with different milk machines. Reference has been made to several dairies in New York which invariably express high satisfaction with their work. "They are reaching far beyond our expectation," says one dairyman, "milking the cows quicker and better than by hand. The milk is much cleaner and the cows are giving a steady gain in pounds over the hand process. Another important feature is that with milk machines the product can easily be kept at a high sanitary point, no dirt getting into the bucket. Successful milk machines will remove one of the greatest obstacles in the way of profitable dairying." Mrs. M. E. Sherman, the Cultivator's Dairy Editor writes of the milking machine this week.

SHEEP ON FARMS

In the range country it requires a very large territory to keep a small number of sheep. Some years the climatic conditions are such as to tax the range severely. The result is that there is much suffering among flocks and loss to their owners. This is sure to come where flock owners fail to provide sufficient forage to bridge over seasons of shortage.

The mistaken idea that it requires poor and rough land for sheep should forever be relegated to the forgotten past.

"Last year there were distributed from Chicago, for breeding purposes, says the Iowa Homestead, "100,000 ewes. To the average breeder that would appear to be a large number When that number has been been compared with advantages of keeping them it will be found that but a small percentage of the farms have been provided. Why, this number of sheep would only be sufficient for the demands of one week in the Chicago market, and there is a great territory contiguous to that market center where sheep could be kept to advantage.

"Seven sheep to be grazed per acre. These acres are growing no poorer. These seven sheep will produce seven lambs; under good management, more. The wool from the seven sheep and sale of the seven lambs on or about the time they are one year old will bring a much better rent than any tenant is willing to give and instead of the land becoming poorer it is becoming enriched. One hundred dollar-land is not too good for sheep. In fact we know of no way $100 land can be kept up as easily as it can by the aid of sheep."

NECK YOKE SAFETY STRAP

The Country Gentleman gives a short description of a contrivance which a veteran horseman has just put out which is good to use on the ordinary double harness. A ring to which two straps are attached is slipped over the end of the pole, each strap being brought once around the neck-yoke on either side, put through the collar and buckled. In case the neck-yoke breaks, this strap is sufficient to take its place, supporting the pole and preventing the catastrophe that otherwise would occur.

Sheep growers of Maryland are urging the legislature to pass a law to check the ravages of sheep scab. Losses from this cause on hundreds of Maryland farms aggregate tens of thousands of dollars annually. One cause is the great number of sheep brought from the West; many of them suffering from the malady.

WHY DAIRY FARMING PAYS

H. W. Potts, of the Hawkesbury Agricultural College, in Australia, thus summarizes the advantages of dairying:

1. It takes less fertility out of the soil than any other form of agriculture, and hence it is useful in following a well-regulated system of rotation.

2. It can be combined readily with other forms of agriculture or horticulture.

3. The dairy provides in winter a quantity of stable manure in which the straw from the barn is profitably utilized.

4. The by-products from the cow skim-milk, whey, and buttermilk, are a source of income in raising pigs and calves.

5. Dairying gives constant and regular employment of a light character to every member of a farmer's family.

6. Dairying inculcates habits of punctuality. industry, cleanliness and thrift on the farm.

7. Cheese and butter are condensed products, and the cost of carriage, in comparison with their value, is less than that of any other farm product.

8. The demand for good butter and cheese on the world's markets is unlimited, and, so long as the quality is maintained an all-round, even and profitable price can always be secured.

9. The monthly check from the factory provides the mainstay in the household, as against the precarious returns from yearly crops.

10. In mixed farming, the income from the dairy is the most reliable.

11. The farmer's household, as a result of the dairy work, is always supplied with fresh milk and cream, butter, cheese, pork, bacon and veal.

12. Storekeepers, traders, bankers, financial men and politicians all fully realize, after years of experience, that wherever dairy farming is conducted farmers are most prosperous, mortgages are rarely found, and the value of landed property becomes considerably enhanced.

IMMENSE BUSINESS IN SHEEP

During the year just closed Haley & Saunders of Salt Lake bought and sold 760,636 sheep, purchases being made in California, Oregon, Idaho, Montana, Nevada, Utah, Colorado, and New Mexico.

Eighty per cent of the vast number of sheep purchased were shipped directly to eastern markets, the remaining 20 per cent being disposed of on the ranges.—Salt Lake Tribune.

BERMUDA GRASS.

Editor Cultivator: As I have been a subscriber of your valuable paper for two years, I would like to ask a question. Would crude oil put on a patch of Bermuda Grass kill it, and can you still raise a crop on the land the following year, or say, put on the oil a little while to soak in and then burn it, would it kill the grass then?—J. T., Anaheim.

Bermuda Grass is as persistent as any plant we have, and oil enough to kill it will render land unfit for any other crop for some time. By allowing it to go undisturbed until next year the oil would mostly dry out of the soil. By deep plowing you would probably be able to grow any crop, but the matter of applying oil to soil is a serious one.

BY MRS. A. BASLEY, HOLLYWOOD, CAL.

PURE BREEDS VERSUS SCRUBS.

This question of breeding in line has been before our readers for several weeks, but I have not yet considered the "no-breeding-at-all" side of the breeding subject. It might have come under the head of "cross-breeding," if I had wanted to handle the subject with gloves, but I really think it is better to call a spade by its own name and a "cross-bred in the second generation degenerates into a scrub.

A point that the average farmer's wife does not seem to understand is the importance of keeping one breed only if the flock is all to run together. It will not do to mix the breeds, especially in winter when eggs are high and you want to have plenty. Why not? Because the different breeds require different handling. The treatment that will suit a Brahma, for instance, will not suit a Leghorn.

If, for instance, wou have a flock consisting of Leghorns, Plymouth Rocks and Langshans and you feed them all alike, and treat them all alike, you evidently cannot suit them all. It would be somewhat as if a man were to house and feed a draft horse and a trotting horse or a pony alike, or a beef and a milch cow. Of course the hen and the horse and the cow would all keep alive, but it ought to be evident to any one that they are not existing under the best conditions, or conditions where they will be the most profitable to their owners and it is the profits we are after.

Fowls may be roughly divided into three classes, the Asiatics (the Cochins, Brahmas, and Langshans,) the Mediterraneans (Leghorns, Anadalusians, and Minorcas, and Spanish) the Americans (Plymouth Rocks, Wyandottes, Rhode Island Reds, etc.) The Asiatics are great meat producers, but lay comparatively few eggs, the Mediterraneans are great egg producers, but are light weight and are not considered good market fowl. The Americans are the all purpose fowl. between the other two. The Asiatics have been compared to the draft horse the Leghorns to the trotting horse, and the Americans to the general purpose horse.

Would it pay any farmer to mix up these breeds of horses or to feed and treat them alike? Let him cross and recross his diverse breeds of horses cows, hogs, sheep, and what will he finally have? Nothing but scrubs.

Scrubs may be all well enough in their way, but the great trouble is that you can never know what a scrub will turn out to be. You can never depend upon it. It may be good, it may be bad, it may be nothing. On the other hand if you have a pure breed of any animal, cow, horse, sheep pig or hen, you can be reasonably sure what that animal will be, what it will do, with some degree of certainty, not always may be, but surely with more certainty than you can count upon a scrub.

If you have Cochin eggs in your incubator, you know just what kind of chicks you will hatch. If you have Leghorn eggs you know just what to depend on. You can make your plans accordingly. If you have Cochin chicks you will not plan for many eggs if you have Leghorns you will not count on having much dressed poultry for market, but can count on having a large number of eggs to dispose of. With pure breeds you can depend on these things with some degree of certainty.

If, on the other hand, you have a lot of hens that are a mixture of various breeds, you can depend on nothing. You will only know what you have when they mature. You can count on nothing certain in the way of either chickens or eggs. That is the reason why men who make a living from poultry keep their breeds separate, and do not let them all run together.

* * *

If vou absolutely must have mixed fowls (this is for a dear friend of mine) choose all your fowls of one class, for instance, choose all of the Mediterranean class, if you want white eggs, you can then feed them alike, and care for them alike and they will do better than yours have in the past, although it makes one shudder to think of what may result from a Leghorn-Minorca-Blue Andalusian cross, it still will develop into a less objectionable and a more easily handled flock than your present one of barred Plymouth Rocks, Minorcas, Leghorns and Buff Cochins.

With the flock all Mediterranean, you can feed them all alike and not have the same experience as in the past, some so abnormally fat they could not lay, whilst others seemed thin, so thin that they did not lay, you will also have the same colored eggs, and not all shades and sizes.

The Leghorns being nervous and much more active than the Cochins require a wider ration that is, one more fattening. Or if you want to keep the general utility fowl keep to the American. The Plymouth Rocks, Wyandottes or Rhode Island Reds, are the most popular Americans. require the same sort of food, the same amount of food and the same care and handling and you will know what to expect from the chicks, and the eggs will be about the same color, and size.

"Cross-breeds," "no-breeds" and "scrubs" are a snare and a delusion. They are not as healthy as the purebreds, and you cannot count upon them for anything at all, either as meat for the market or as egg producers.

My advice is to keep one breed only, the one you most like, and breed that one for all that it is worth—breeding your best fowls and from those only. Develop a good egg-laying strain, keep them clean and comfortable, give them exercise and plenty of the proper food and you are sure to make a success of it. And for my friend whose flock is always a trial to me, I would say, decide upon one breed, kill off all those scrub active, lively cockerels, and get one pure bred cockerel and some settings of pure bred eggs before the season gets too late and next year try only pure breds.

One of the best preparations to prevent a fence post from rotting is to mix linseed oil and pulverized charcoal to a consistency of paint and paint the post with it. A post prepared with this preparation set for seven years is said to exhibit but little or no signs of decay.

BRIDE TEN MINUTES OLD.

A young woman in Westphalia was to be married recently but it was found that her birth had never yet been recorded, which made her a marital impossibility.

He birth was then registered and according to the documents preceded her marriage by about ten minutes, making her the youngest bride on record.—New York Tribune.

EDITORS QUESTION BOX.

Lice Mites. (H. S., Riverside.) I would like to ask the best and most convenient remedy for the yellow chicken lice on hens; also if the head lice on little chicks are same kind, and if the little red mites do not kill off the hen lice. It seems that my hens don't have both at the same time.—Riverside.

Answer. For yellow lice on hens, powder them well with Lambert's death to lice, also paint the bottom of a barrel (I use a piece of newspaper painted at the bottom of the barrel) with Lee's Lice Killer, cover with a gunny sack, and keep hen in for two or three hours. Look for nits (eggs), and pull the feathers out on which they are, putting the feathers into kerosene and burning them.

For head lice on little chicks, carbolic salve or carbolated vaseline is the best, or take some warm suds put in a half teaspoon of carbolic acid to a quart; take an old tooth brush and once a week brush each little head carefully over. Do it in the morning on a sunny day.

I wish the mites would exterminate the lice. You must be thinking of Dean Swift's saying (was it his?).

"Big fleas have little fleas
Upon their backs to bite them.
And little fleas have lesser fleas,
And so ad infinitum."

Fleas and lice are commencing earlier than usual this year, so much so that I think next week we must take them for our topic.

* * *

GEESE.—(Mrs. W. F., Chino.) I am a reader of the Cultivator and I come to you to ask if you can help me any about my geese. I have one goose that lays a soft-shelled egg, every other egg. They have water to drink and to swim in. They have shell to eat. I feed them green barley at noon, morning and night; they have barley and corn. I give them Swift's meat meal. I keep them in a large correll. If you can help me I woud be very glad. My geese are a year old.

Answer. Geese are birds that graze like cows or sheep, and they will not do well unless they have some green grass or alfalfa, or a awn to graze on. Your goose is not getting sufficient green alfalfa and consequently the oviduct is in an unnatural state and cannot secrete the proper material for the egg shell.

Give the geese crushed oyster shell and either green alfalfa or afafa hay cut in one-fourth of an inch length and scalded. Also provide them with plenty of coarse sand or grit. Green barley is good, but there is not enough lime in it to make good firm shells.

* * *

Various Questions. (Subscriber Riverside.) Editor Cultivator.—Will you kindly answer the following questions and oblige a subscriber.

How are thoroughbred fowls identified? Are they registered as are live stock?

How long can eggs for hatching be kept? At what age are a hen's eggs the best for hatching?

What breed of chickens are Asiatic, American and Mediterranean

Is it possible to determine whether an egg is fertile or not before starting incubation?

Would White Plymouth Rock pullets hatched in November moult the following fall?

Answers. Thoroughbred fowls can only be identified by their leg bands riveted on their legs. Some also have holes punched in their feet. They are not registered like other live stock.

The sooner after eggs are laid that they are incubated the better and stronger will be the hatch; they can be kept three or four weeks, but the hatch will not be very good.

I have found two or three year-old hens give me the strongest, largest chicks.

Asiatics are called by Chinese names Cochin, Brahma, Langshan. American breeds are those made in this country by the judicious and careful crossing of some of the foreign breeds to get the general purpose bird. They are the Plymouth Rocks, Wyandottes and Rhode Island Reds.

No.

Yes, they would probably moult early and begin to lay again in the early winter.

WATER GLASS.—(R. M. B.) Will you give me the water glass receipt for preserving eggs? Please let it be given in next week's Cultivator.—R. M. B.

Answer. The water glass receipt is: take ten quarts of water that has been boiled and is cooled, add one quart of water glass, stir well, pack the eggs in a crock or a jar or a wooden bucket, pour the mixture over them, keeping them always at least one inch below the water by placing a board and stone on top. If you had given me your office address I would have answered by mail.

WATER GLASS OR LIQUID GLASS.—(M. K., Oxnard.) Editor Cultivator: Will you please answer me through your valuable paper the following questions and oblige yours truly: Where can I procure silicate of soda or water glass, is there two kinds or not? How much is it per lb., in 5 or 10 lb. lots?

Answer. You can procure water glass, silicate of soda at most drug stores. In Los Angeles the Sun Drug Stores sell it at 85 cents for one gallon or by the five gallons at 65 cents per gallon. The Owl Drug Stores sell it at $1.00 per gallon for one galon or 90 cents per gallon quantity and 80 cents per gallon by ten gallons. There are two kinds silicate of soda, and silicate of potash. the silicate of soda is the cheapest.

COOPS.

What is the best way of making coops for poultry. Do they have to be built as strong and expensive as in the East, where the winter is longer and colder?

Coops need to be built light. Cracks through which draughts flow are productive of roup. Plenty of ventilation, however, is necessary. Coops built on stilts where the air circulates beneath the roost are sanitary. They must be made strong enough to resist wind of course.

SCALY LEG.

Did you notice an ugly incrustation on the legs and toes of the old fowls the past season—a dirty roughening of the surface, which gave you a feeling of disgust, when you were obliged to handle them? This is scaly leg, and if there is one of these old fowls housed up with the young stock the entire flock will be affected in the same manner next summer. Scaly leg is a parasitic disease, and it will be passed along from one generation to another until means are taken to destroy the parasite which gives rise to it. It is not a difficult matter to destroy the scaly leg parasite. Kerosene and lard will do the work very effectually; so will a few drops of carbolic acid mixed with a cheap grade of olive oil. A few applications of this to the affected parts at intervals of two or three weeks is death to the parasite, and after that the scales will loosen and fall off. In bad cases the legs will never be restored to their original smoothness, but their appearance will be greatly improved. If one application of the mixture is made to the legs of the pullets and cockerels, and the perches are occasionally painted with kerosene, you may be assured that this unsightly disease has been banished from your flock. Scaly leg must not be confounded with bumble-foot, which is a much more serious affection. The latter is confined to the under part of the foot, and is a soft, pulpy ulcer which exudes pus and blood when punctured, and it should be treated as any other ulcer. It is hard to cure, and it does not pay to attempt it except in the case of very valuable birds.

Paint the interior of the henhouse with Portland cement and skim-milk. filling all cracks thoroughly. It will help check mites.

A hen is an everlasting eater. She pays well for good food. For poor food she pays nothing.

It would be well for those who refer to the poultry industry as a small business to ponder on what the Hon. James Wilson, Secretary of Agriculture, says in his recent report of the hen and her products. "The farmer's hen is becoming a worthy companion to his cow. The annual production of eggs is now a score of billions,

200 Eggs a YEAR From One Hen

CAN YOU show this record?
How many possible eggs have you lost—eggs which you might have had—if you had been using a feed which had been tested for you.
A Feed which makes a 200 egg Hen out of a Scrub, and makes a 200 egg Hen lay 225 to 250 eggs a year. Figure it out.
How can you afford to make expensive personal tests, when
PURINA POULTRY FEEDS
will bring out every egg your hens are capable of laying. A feed which will bring EGGS in Winter as well as in Summer—40c Eggs as well as 12c Eggs—from ALL your hens.
And you don't have to take our word for it, either—just try PURINA FEED at our expense, and believe the evidence of your own senses—that's all. It won't cost you a red cent to prove us right or wrong.
If the results don't come, just tie up the bag and write us, and we will return every penny of your money and tell you what to do with the unused feed. You are not out a cent in making the trial, for we will supply you through your dealer or direct FREIGHT PREPAID and the feed used in testing costs you nothing.
This is the Money Back Line—
Write today for particulars about our FREE TEST Plan.

PRACTICAL INCUBATORS positively the best. Hatches more and stronger chicks. 10 YEARS' GUARANTEE

Cat. free. PRACTICAL INC. CO., 720 S. 11th St. San Jose, Cal.

Why do you pay $5.00 to $8.00 per hundred for eggs for hatching when you can get just as good eggs from just as good stock from us at one half that price? Our stock is large and healthy. The hens lay lots of large white eggs that run as high as 98% fertility. We sell eggs in incuator lots only at $2.50 per hundred.

Avenue Poultry Yards, Ventura, Cal.

and after supplying the needs of factories, tanneries, bakeries and other trades, they are becoming a substitute for high-priced meats, besides entering largely into the everyday food of the people. Poultry products have now climbed to a place of more than half a billion dollars—$500,000,000; and so the farmer's hen competes with wheat for precedence."

RICE AS FOOD.

Rice is highly recommended as a staple food; not to be served occasionally as a desert, but as an everyday diet. The rice grain contains a large per cent. of starch, so it can take the place of potatoes. The complaint is made that too much of the nutritious part of the grain is taken off in the milling, but millers say that this is done in the polishing and that there is greater demand for it if thus prepared.

The Japanese are a rice-eating people and during the late war it has been observed that they have great endurance and that their wounds heal quickly. These two observations are strong arguments in favor of rice as a staple food. Experiments show that rice is easily digested. This makes it especially suitable for food for children, or people having weak digestive organs. It is claimed that dyspepsia may be cured by the free use of rice as food. Writers of tokology recommend rice as a food for women during pregnancy. It is not a bone-forming food and experience has shown that much pain and suffering during confinement has been avoided by eating rice freely.

Rice, like potatoes, is not a food of which one easily tires. Since it is a starchy food it combines well with fatty or acid foods and by combinations with them, its flavor may be varied. A dish of boiled rice, served with sugar and cream forms a perfect food for a child. Browned butter may be poured over boiled rice just before serving, or cheese may be served with it. Dried fruits boiled over it form a good combination. Rice and tomatoes served separately at the same meal go well together. Spices, such as nutmeg, cinnamon, curry powder and extracts are used with rice to vary the flavor. Puddings of rice with milk, cream and egg for a complete food. With such a variety of combinations, rice may be sevred commonly without becoming tiresome.

Curry balls are nice to serve with chicken. Boil half a cup of rice until soft, then add the yolk of two eggs, half teaspoonful salt, one teaspoonful curry powder, one teaspoonful grated onion, mix well together. When partially cooked make it up into balls about the size of hickory nuts; roll them in the slightly beaten whites of two eggs; then roll in fine bread crumbs or flour. Fry in deep, hot fat until brown, or else brown them in butter.

A double boiler is the best utensil for cooking rice, as it will thus take care of itself without fear of burning. Then, too, since it does not then need to be stirred but slightly, the grains are not broken to pieces—it comes out in separated grains and not in a mush.

It is a curious fact that a boy's hair grows one-half slower than a girl's. In boys the average rate of growth is three feet three inches in six years, being an average of 0.018 inches a day. During the twenty-first and twenty-fourth years a man's hair grows quicker than at any other period. It takes an eyelash twenty weeks to reach a length of 0.429 inches, and then its life is from 100 to 150 days. By means of a camera the wink of an eyelid has been measured, and it was found that twenty winks can be made in four seconds.

Be sure that your setting hens are free from lice before they hatch; if you do not watch this your chicks will soon begin to droop around and die. This is caused by head lice which can be found on their head and neck. The best remedy to get rid of head lice is to grease your chicks' heads and necks with sweet cream.—Fancier's Gazette.

The Menlo Park Horticultural Society is considering the advisability of holding its spring exhibition at Redwood City.

Standard Bred S. C. White Leghorns

EXTRA LARGE BIRDS AND HEAVY LAYERS. Eggs, $2 per 15; $8 per 100; $60 per 1000 from January until July only.

LAYING HENS

We have a few choice 1½-year-old Thoroughbred White Leghorn hens, which we are offering at a sacrifice. In order to make room for our young stock we are offering these fowls at $15.00 for 12 hens and 1 rooster or $100 per 100.

We also have a number of 5-months-old pullets, also of the same variety, on which we can name you the same price. If your stock needs renewing, send in your order at once, as they are going fast.

We have a Hatchery of 50,000 chicks per month capacity, from which we are making shipments daily to all parts of the Coast. If you need any just hatched chicks have your order booked at once, so as to get them on the date desired. Our price for just hatched chicks is $7.50 per hundred f. o. b. Petaluma.

We manufacture the famous MUST HATCH INCUBATORS AND BROODERS and a complete line of poultry supplies of every description. We cater to the best hatching egg trade on the Coast.

Before purchasing write for our new illustrated Catalogue B, which contains descriptions, prices, etc., of all our goods.

Must Hatch Incubator Co.- Petaluma, Cal.

HUMOR OF HORTICULTURE

I've rubbed elbows with that interesting personage known officially as the "Ornamental Horticulturist," or as one of my more learned and editorial friends would have dubbed him, the "Ornamentative Horticulturist." A few years ago he was, I suppose,, the artist who made striped elephants with a fluffy tail and planted them on the lawn, who made butterflies and ships, birds and beasts, biped and quadruped, who had wheels in his head and got rid of them by expressing himself in wonderful convolutions, rings eccentric and concentric, all in plants that outrivaled Joseph's wonderful coat of many colors. The pity of it is for one of the business ends of horticulture that his tribe did not keep on increasing.

I am reminded of a story in connection with that branch of gardening. An itinerant disciple of the "art that doth mend nature" was called in to lay out some beds on a modest lawn. His "art" had not risen above a round, square and star-shaped bed, so when his whilom employer expressed a desire to supplement them with an oval bed he looked embarrassed; he was not quite sure what an oval bed was. It was explained to him that it was egg-shaped, and he understood. When the owner came around the following day and looked at the oval he was disappointed; it was overweighted at one end. He reproached the "artist" concerning it, and a great light broke in upon him when he was told by him: "Sure, sir, you told me to make it egg-shaped; and isn't an egg bigger at one end than the the other?" There is some humor even in horticulture.

A prospective purchaser went into one of the seed shops not a thousand miles from here, where garden and farm implements were displayed, and asked a young clerk if he sold whiffletrees. He was gravely informed that they did not keep them there, but he would inquire of the nursery department. Another purchaser, who was giving an order and soliciting advice from a clerk as to quantities of seed wanted for certain number of plants, finally ordered a pound of raffia. The clerk, thinking he was ordering too much of it, gravely asked him how many plants of it he wantetd to raise. A tree agent some years ago astonished the home office with the quantities of tree paeonias he was selling. Upon investigation it developed that he was recommending them as shade trees, which had in the summer the wonderful flowers shown in the picture book which he carried. There are incidents connected with the business end of horticulture and they do much to relieve the tedium of the day and hour.

An acquaintance of mine in the trade once sagely remarked in my hearing that in his opinion any fool could grow good plants, but that it required a man of great wisdom to sell them. It looked to him as if he had discovered the business end for certain. I may remark parenthetically that the gentleman referred to was a grand and gloomy failure in both departments; he is a fair sample of the know-it-all. There is a story told to the effect that a young man who was ambitions to succeed in business once obtained the ear of the late Commodore Vanderbilt and sought his advice. He is reported to have asked him if the secret of success in business was knowledge, or was it some fortunate inspiration? The gruff old Commodore tersely replied: "No, my young friend; not inspiration; perspiraation, sir, perspiration." And it may be truly said that if the business joint of horticulture is anywhere in particular, it is at the elbow, and it should be well greased.—P.O'Mara.

USE FOR OLD NEWSPAPERS.

A combination of printer's ink and paper has many uses as a patent medicine possibly being taken externally as well as internally.

If one is of a thrifty disposition, the accumulation of daily newspapers in the house is a constant thorn in the flesh and finally the garbage collector is subsidized to remove this inoffensive little article. But a goodly pile of papers is a handy thing to have in the house, while the kitchen work is considerably lightened if they are habitually used.

One use is to always spread papers upon the table before preparing a meal at the completion of which they can be easily removed and there is no necessity of scrubbing. A paper wiped over grease spilled on the stove will save an extra blackening, while nothing is better than newspaper to impart the final high polish to windows and mirrors. They may be also used in packing china and glassware, not forgetting that if woolen goods are wrapped in newspaper that the pesky little moth will fight shy of that particular package. Many a case of pneumonia might be avoided if several thicknesses of paper were laid over the chest and across the back before venturing out of doors in cold weather, while layers of the same thing will take the place of weather strips if Jack Frost catches us unawares and our tenderest plants may rest secure under the same protecting wing.

In the sick room a pad of newspapers is a great protection to the bedding and a great saving to the laundress. These may be made as thick as desired, covered on the upper side with a layer of cheap cotton wadding and held in place by a covering of a piece of old sheeting tacked loosely with strong threads.

"'Tis the mony mickles that make the muckle." A daily paper seems after morning perusal the very acme of "has-beens" but try saving them, and if you do not find numerous uses for it why twist it up in a hard knot when the kitchen fire is out, and lighting a match to it start a fire that will boil sufficient water to make your cup of five o'clock tea.—Mary M. Cross.

On the farm a pound of poultry meat can be grown at less cost than a pound of beef.

Veterinary

BY DR. W. J. OLIVER,
318 East Second St., Los Angeles

To the end that this department may be made as valuable to the subscribers as possible, we ask observance of the following: Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared. Give your name and address, which will not appear in the paper if you so request. No charge whatever is made for such questions as are answered through the colums of the Cultivator, but when an immediate mail answer is wished Dr. Oliver asks an additional fee of $1.00 and will give immediate attention and reply by mail. In such case write Dr. W. J. Oliver, 318 E. Second St., Los Angeles, Cal.

Questions should be in by Monday to be answered in the following Friday's paper.

CHRONIC COUGH.

Editor Cultivator: I have a seven year old horse that had the distemper two years ago, and has had a cough nearly ever since, especially in winter when he takes cold he is worse. Last winter he run at the nose considerably. I doctored for that, and he has very little now. but he coughs about as last winter and seems to cough up mucus from the throat which flies out of the mouth when drinking. His neck is somewhat stiff and drinks from a bucket setting on the ground with difficulty. I am giving him Kendals powders (pulv. gentain and pulv. sulphate of iron) and will follow that with a plaster along the wind pipe as he directs. This part is explanatory and the following is what I would like to know about also. The horse while standing is constantly resting one or the other of his fore legs by resting his toe on the ground and having his knee bent forward, shifting from one to the other occasionally. What makee him do that? And what can I do for it? And what more or bettre can I do for the cough, stiff neck, or treatment as explained in the first part of this inquiry. Any suggestion on any phase of the case will be kindly and thankfully received.—I. N. D., Porterville.

The cough is of chronic form, caused by thickening of the mucus membrane of the larynx and some derangement in the recurrent nerve and affects the horse more when eating or drinking or when first brought out of the stable. This cough is hard to cure in chronic stage. Smith's Glyo. Hereoine given according to directions, 1 oz. three times a day, will do the most good. The resting of one or other of the fore legs is caused from stiffness in shoulder muscles, probably rheumatic. Rub in a little liniment, equal parts of equa ammonia, turpentine and oil once a day.

SHAVING EVERY DAY

Shaving is a job that has to be done over and over. It's a mighty ticklish job to keep the face in shape if the razor and the hand and the soap are not just right. The soap is about as important as anything. It's easy to get and hold a bad case of sore face by using the soaps that are used to wash soiled clothes. It's taking grave chances, and no excuse for it either. William's Shaving Soap, made only for shaving, costs very little. It's so much safer and it makes shaving so much easier. Anybody can get a sample free by writing the J. B. Williams Company, Glastonbury, Conn., where they make it.

GOOD WORDS

It pleases the Cultivator to give good results to advertisers although at times we lose their business temporarily. It paid them once—and they will come back.

Tropico, Cal., March 8, 1906.
California Cultivator:

Gentlemen:—Having disposed of all my plants you will please take my ad out of the paper and send me bill to date, including a year's subscription to your paper. I have received very satisfactory results from the advertisement placed in the Cultivator and shall be glad to make use of it in the future. Your, truly,

D. GRISWOLD.

Whitier. Cal., March 8, 1906.
California Cultivator:

Gentlemen:—Please discontinue my advertisement in your paper as I am all sold out. Yours truly.

A. R. RIDEOUT.

ACETYLENE FOR LIGHTING PURPOSES

The conveniences of the city, which are coming more and more to the country home, enhance the pleasures of country life until it is now the aspiration of professional as well as business men to have a small place in the country where many advantages are greater than those of the city, and but few of the discomforts and annoyances which the city has are to be found.

The trolley, phone, and acetylene gas for lighting and cooking purposes are becoming more and more common and thus supplying the comforts and pleasures of home life to the country folk which have so long been needed.

There are several acetylene generators for producing acetylene gas for lighting and cooking, but one of the best of these which we have ever seen or heard of, is made by the Superior Light and Heat Company of Los Angeles. It was the pleasure of the writer to be taken through this plant located at 151-153 N. Clarence Street, and it is indeed the most complete factory for the manufacture of the machines that could well be conceived and the whole character of the place as well as the business is indicative of positive and responsible work and results.

The gas manufactured by this effective machine is claimed to be superior to ordinary gas or electricity for lighting and cooking besides an additional advantage in that the gas is not poisonous to persons nor plants as ordinary gas is.

The advantages of this system of lighting are many besides those mentioned, and the Superior Light and Heat Company will be glad to answer any questions or give any further information to any one who will drop them a line or call at their new factory.

Irrigation

IRRIGATION ..BY ..GASOLINE POWER.

A great deal has been written on the subject of irrigation, usually referring only to the large and extensive plants; but to the average stockman or ranchman, the isolated irrigation power plant is an absolute necessity. The requirements in the way of power and equipments vary according to the conditions. For deep wells, force pumps, and special geared pumping engines having the entire engine equipment connected on skids in as convenient and simple manner as possible, will give better results. Particularly where the walking beam style engine is preferred.

Where the water is to be forced considerable distance to a tank or reservoir, then the force pump operated by a special semi-portable gasoline engine arranged for moving around is used.

Where the water is to be raised from ten to thirty feet and very large quantities are required. the centrifugal pump operated by a stationary or semi-portable gasoline engine, if properly constructed, will raise a large amount of water at small cost.

RECLAMATION WORK.

Under the reclamation act the national government will construct the largest irrigation works in history, far exceeding those of Egypt or India. The reclamation act provides that funds from the sale of certain public lands shall be applied by the government to the building of irrigation works. At the present time this fund amounts to about $28.000.000 and is increasing at the rate of $4,000,000 annually.

This fund is self-continuing. After the irrigation works have been constructed the sum expended by the government in any one work is to be returned to it in ten annual installments by the settlers pro rata. At the first year after any one project has been completed, one-tenth of the original amount expended on that work is to be returned and put into other projects. Fifty million acres of arid land at present totally unfit for agriculture, will be opened to the settler through the huge irrigation works which the government will build under the national irrigation act.

TO TEST WELL.

Editor Cultivator: A new well is being put down, and I am anxious to have it tested to ascertain the quantity of water that may be pumped from it. I have no pump by which to test it; can it be tested correctly by putting in a certain quantity of water, and calculating by the time that it would take to sink to the original water level?—J. R., Santa Paula.

The method as stated above would be of no value. There might be a very porus bottom that would allow the water to escape very rapidly while the supply in the well might be very small It is quite probable that if the supply in the well is strong that the water poured in at the top would be longer in finding the original level than if the supply is weak. There is no way of determining what a well will furnish except to put on a pump and run it a few days. Wells usually increase their flow after pumping some time.

UNCLE SAM'S IRRIGATION.

Millions of arid land in the west will be thrown open to the farmer through irrigation and the huge projects which the government has on hand under the national irrigation act, will, it is claimed by the most enthusiastic irrigation experts, open the way for the mightiest Anglo-Saxon civilization the world has ever witnessed.

Among these great works undertaken by the government is the Shoshone project in Wyoming, which will irrigate 160.000 acres of public land; the Uncompahgre valley project in Colorado, 10,000; the Belle Fourche project in South Dakota, 85,000 acres; the Salt river project in Arizona, 200,000 acres; the Malheur project in Oregon, 90,000 acres; the Honda river project in New Mexico, 10,000 acres; the Fort Buford project in Montana, 60,000 acres; the North Platte project in Wyoming and Nebraska, 300,000 acres; the Mindoka project in Idaho, 130,000 acres; the Yuma project in Arizona and California, 115.000 acres; the Truckee-Carson project in Nevada, 350.000 acres; the Klamath project in California, 2,000,000 acres.

Besides the projects enumerated, which total no less than 3.600,000 acres, the engineers of the reclamation service are preparing plans on a great many other projects which will be undertaken as rapidly as the fund expands and is returned to begin the work.

A PLAN FOR SUB-IRRIGATION.

A. Hemmant says in the Denver Field and Farm: I have a very small irrigation plant raising water from a well by wind power, using part of the water for surface irrigation and part for sub-irrigation. For sub-irrigation I use three-inch tile laid fourteen to sixteen inches below the surface in rows five and one-half feet apart, the rows connected by a head row in which is laid one T joint for each lateral row. The rows must be absolutely level, not following the inequalities of the surface in order that the low places shall not get more water than the higher ones and the ends of the rows must be closed with brick or some other stone, so that moles, rats or other vermin can not get in.

A square box set in the ground at one end of the head row gives access to it and from thence to all other rows and it should have a wire netting over the top to keep out trash as well as vermin. The top of the box should be raised above the surface of the ground enough to keep out storm water, as by that means mud and trash would be carried in and fill up the tilings. The tile is porus and the uncemented joints allow the water to pass through freely.

This mode of irrigation has several points to recommend it above others: First—One can turn on the water and not have to watch it. Second—The ground does not begin to bake in a few minutes after the water is stopped as in the case with cultivated ground under surface irrigation. Third—Most of the moisture being several inches below the surface the rootlets go down instead of spreading out near the top of the ground as in surface irrigation where they are likely to be burned by the hot sun and torn by the cultivator.

Auction Sale!

—On Donohue Ranch—

1 Block East of Latin on Long Beach Electric line, 1 bl'k West of Florence on Shorb Avenue, at 10 a. m.

Tuesday Mar. 20

70 Choice Milch Cows—
Holsteins, Jerseys and Durhams, fresh and coming in soon. Large milkers and in good condition.
5 Yearling Heifers, 2 Work Horses
1 Driving Horse, 1 3-yr-old Colt.

Implements—1 milk wagon, good as new; 1 one-horse wagon: 1 late improved distillate boiler for steaming cans; milk cans; Stantions for 50 cows, harness, etc. Terms—8 months time with note and approved security.

On account of sub-dividing my ranch, I am closing out my entire diary and will absolutely sell to the highest bidder without reserve.

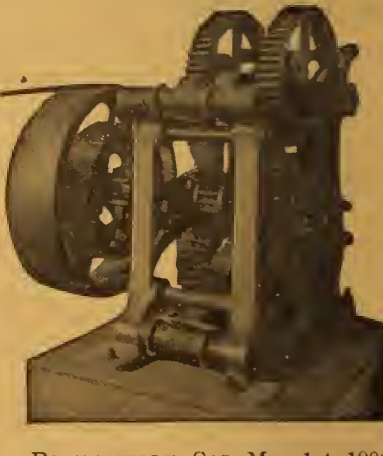
The Pomona Pump



PORTERVILLE, CAL. Mar. 1st, 1906
The Pomona Manufacturing Company of Pomona California installed a deep well pump for me last October consisting of a No 28 head and 10 inch cylinder placed ninety two feet below the surface. It lifts fifty five inches of water from seventy five feet or more below the ground and forces it through a pipe line one half mile long sixty five feet above the pump. It has been run for four months and has been using about twenty six horse power for the whole plant.

The pump has run without any delay or repairs of any kind and is satisfactory in every respect.

CHARLES BOYDSTON.

The above Pump was installed where the owner had been using a Centrifugal Pump and had been paying for 41 Electric Horse power and obtained less than 50 inches of water, making a difference of 15 horse power, saved by the Pomona Pump, or a saving of $750 per year for power alone.

We have saved this for Mr. Boydston. We may be able to do it for you.

POMONA MFG. CO.

Queries and Replies

Editor Cultivator: where can I get the Homemaker?—Mrs. F. E. S. Merced.

Write to Washington, D. C.

TOMATO CULTURE

Editor Cultivator.—I am extremely anxious to learn all about tomato raising. I have Prof. Wickson's two books, but the subject of tomatoes is not full treated. If you know of any literature on the subject I will thank you much for information as to where how to obtain it. Stamps inclosed for reply. R. L. H., Chula Vista.
ply. R. L. H., Chula Vista.

Nothing better than Wickson has been published on the tomato except certain newspaper articles by practical growers. Can you not find some successful grower to whom you can apply for advice?

HOME ORCHARD.

Editor Cultivator—Please give a list of desirable fruit trees, vines, etc., for light friable soils in the coastal region of Los Angeles or Orange counties. E. J. C., Los Angeles.

Peaches—Yellow St. John, Tewkins Honey, Large Early York, Coolege's Favorite, Lovell, Belle of Georgia, Salway.

Pears—Bartlett, Seckel, Winter Nelis and St. Andre.

Nectarines—Lord Napier and Victoria.

Apricots.—Newcastle, Hemskirke, and Royal.

Plums,—Wickson. Kelsey, Sultan and Bartlett for Japanese Wayland and Will Goose for American varieties. Rivers' Early Prolific and Tragedy for European family.

Prunes.—Prune de Agen.

Figs.—Angelique and White Dalatto for White; Negro Fargo for Black.

Lemons and other citrus.—Villa Franca lemon and W. Navel, Valencia, St. Michael, Tangerine (Daisy) and King oranges.

Quince.—Smyrna.

Grapes, European and Eastern—Muscat, Muscatelle fino, Verdal, Chaselar Rose, Damascus, Cipro Nero, Cinsant. Blue Portuguese and Olivette. Any other recommendations except berries, Eastern grapes, Concord, Niagara Agawam..

Persimmons—Hayachea, (spelled about twenty different ways) and any of the chocolate-colored flesh varieties.

Pomegranates.—Sweet Spanish or Spanish Ruby.

BORDEAUX MIXTURE

Editor Cultivator—How shall I mix Bordeaux for peach curl and other fungus troubles, one that will fertilize and invigorate the trees as I understand it often does. H. R. M., Santa Ana.

It is a little late to use bluestone for most trees, still we re-publish it to help the few in need.

5 ℔s copper sulphate (bluestone).
5 ℔s quicklime.
50 gallons water.

Dissolve the copper sulphate (bluestone) in a barrel containing 25 gallons of water. Slack the quicklime and then add sufficient water to make 25 gallons of milk of lime. Until the two solutions by pouring one pailful of each at the same time into a third barrel. The milk of lime should be well stirred while being dipped from the barrel and should be passed through a fine wire screen when poured into the mixing barrel, but the copper solution should not be passed through the screen. Stir the mixture thoroughly at first and also occasionally when being applied as a spray to the trees.

In the preparation of the Bordeaux mixture it is necessary that the ingredients should be mixed in a wooden vessel. If an iron vat is used for dissolving the copper, it will go to the iron and the effect of the spray is largely neutralized. After it is prepared the mixture may be applied to the trees from the usual galvanized iron spray tank. Apply the remedy cold and as soon after it is prepared as possible. Never allow it to stand over night.

The above spray is a fertilizer and invigorator of the tree and will effectually prevent curl leaf if applied very thoroughly from one to three weeks before the buds open. This remedy can be applied with safety until the buds finally burst into full bloom.

Of bluestone only the best quality should be used. There is a good deal of variation in bluestone, as it contains always more or less iron sulphate or copperas, but this is readily discernible and a sample that contains any considerable amount of rust color copperas should not be used.

Climate and Crops

General Summary.—The weather was pleasant and warmer than usual during the first five days of the week throughout California. Saturday and Sunday were in marked contrast to the beginning of the week. The most violent storm of the year prevailed at the time this bulletin went to press. Througout the Great Valley and along the entire coast high southerly winds, changing to equally high northwest winds have occurred. Heavy snow is falling in the Sierra Nevada and light snow in the Coast Range. Snow will probably fall in the Sierra Madre. A thunderstorm is reported at Los Angeles.

Heavy rains are reported in the northern counties including an inch in twenty-four hours at many places. The rainfall has also been heavy along the southern coast.

The other noticeable feature of the weather during the week was the exremely warm spell in the section south of the Tehachapi, Thursday and Friday afternoons. Temperatures reached as high as 86° at many points, in the afternoon.

Sacramento Valley—Warm, pleasant weather prevailed until Saturday, when the skies became cloudy and northeast winds set in. The winds increased in force and by Monday morning were blowing at the rate of 30 miles per hour. The snowfall has been heavy in the Sierra, but there was no cold weather of any consequence. Warm weather on Thursday and Friday caused a moderate melting of the snow and a fair run-off. At the close of the week there was still more than twelve feet of snow reported at Summit and this amount will be added to by the present storm.

* * *

Coast and Bay Sections.—The weather was clear, warm and pleasant during most of the week. Light easterly winds prevailed in the mornings and moderate westerly winds at night. Sunday was cloudy, with occasional squalls, and Sunday night and Monday morning stormy. High southerly winds were reported at all points on Sunday night and Monday morning. Velocities exceeding 60 miles an hour were recorded in Marin county. There were no frosts during the week. Rain fell in scattered showers Sunday and a heavy rain early Monday morning. Temperatures exceeding 70 degrees occurred on Wednesday, Thursday. Friday and Saturday.

* * *

San Joaquin Valley.—Clear, warm weather prevailed until Sunday, when cloudy, unsettled conditions occurred. Afternoon temperatures ranged from 74° to 76°. The seasonal rainfall at Fresno is approaching a fair average. There is considerable snow in the mountains and the present storm will add materially to this. The winds were for the most part light and from the north, until Saturday night, when fresh, southerly breezes began. High south winds were blowing at the close of the week.

* * *

Southern California.—Settled weather prevailed in all counties south of the Tehachapi until Saturday. It was very warm early in the week, with temperatures ranging from 80° to 86° in the afternoon, or from 12 to 16 degrees above the normal. The close of the week was marked by high southerly winds, generous rain and occasional thunder squalls. The wind at San Diego reached a velocity of 36 miles per hour from the northeast Monday morning. The seasonal rainfall at Los Angeles is now in excess of that of the preceding season. The rainfall during the present season has been not only generous, but remarkably well distributed.

Williams' Shaving Soap

Suppose your dealer *does* make a few extra pennies by recommending an inferior shaving soap! What good does that do you? It is your face that suffers — not the dealer. Insist upon Williams'.

LITTLE HELPS BY THE WAY.

Smile once in a while,
  'Twill make your heart seem lighter;
  'Twill make your pathway brighter.
Life's a mirror—as we smile,
  Smiles come back to greet us;
If we're frowning all the while,
  Frowns forever meet us.
—Nixon Waterman in the "Merry Mood.'

FAMILY SCRAP.

A Kansas poet has given the public the following:

The farmer sows his crop,
  His good wife sews his clothes.
The farmer darns the winds,
  And his good wife darns his hose.
The farmer pitches in the hay,
  But should he cross her whim,
The good wife lays aside her work
  and pitches into him.

"GIVE US THIS DAY OUR DAILY BREAD"

The art of bread-making is one of the highest accomplishments a woman can attain. No young woman is fit for a wife who has not learned to bake bread. More diseases of the stomach come from bad bread than from almost any other cause. It produces dyspepsia and dyspepsia aggravates a hundred other complaints. Half the human race suffers constant misery from the daily bread it eats, It would be a boon were it cut out of our bill of fare. But were it always sweet wholesome and well baked, life can longer be maintained on it than on any other single article of diet.

"Give us this day our daily bread," but give it to us in nature's best form, light, sweet and pure.

Laura Linton writes about bread, that it is one of the earliest, most generally used and most important forms of food adopted by mankind. With good bread the plainest meal is a feast in itself. Without it the most elaborately prepared menu is unsatisfactory. Bread making is at once the easiest and most difficult branch of culinary sciences—easy if the elementary principles are mastered and followed, difficult if there be any neglect to use proper care and materials. It should be regarded as one of the brightest accomplishments, and if a fraction of the time and thought which are expended upon fancy cooking were devoted to this most important article of food, the sale of remedies for digestive ailments would be appreciably decreased.

As bread is used in every household almost every day in the year its food value is of interest to us. Life could be sustained indefinitely upon bread alone, but the body would not be properly nourished. Fine wheat flour contains about seventy-five per cent starch and about ten per cent nitrogenous matter, but is quite deficient in fat. Bread and butter make an almost perfect food, forming a fairly well "balanced ration."

"Of all the cereals, wheat yields the best flour for bread making. This is due to the fact that it is the only grain which contains the constituent, gluten, in the proper proportion, and of the desired quality, essential to making light, spongy bread. When the starch is washed out of a quantity of flour the gluten will remain as a greyish-yellow, tough, elastic substance, which can be drawn out into threads. It is the most valuable part of the wheat, being the proteid, or flesh-former.

The greater part of the wheat grain is starch. That part of the starch lying nearest the bran cells contains the most gulten. As this part of the starch is hard and closely attached to the bran, much of it is lost in the manufacture of our white flour. A great quantity of the mineral matter—that which goes to form bones and sustain the nerves—is also carried off in the bran. Those who advocate the use of whole wheat flour, maintain that because of these losses our wheat flour has degenerated into a lifeless and unsatisfactory food.

While it is true that whole wheat is richer in some valuable constituents than white flour, and that in the system of some persons it has a most beneficial effect, it does not necessarily follow that bread made from it furnishes more nourishment than white bread. Whole wheat flour contains bran, and bran is composed largely of cellulose. Cellulose is practically indigestible to the human system. A certain amount of it in our food is a necessity, but taken in this form it is not only undigested itself, but owing to its thick coatings its protects from the action of the digestive juices a large proportion of the nutriments contained in the flour. It also acts as a mechanical irritant and is hurried along the digestive tract too quickly for complete assimilation to take place. From practical tests it has been found that white bread furnishes more energy than an equal weight of whole-wheat bread.

Good flour should be creamywhite in color, should not pack easy, and when squeezed in the hand should not fall apart when the hand is opened. It should have a grainy feeling rather than a velvety touch. Velvety flour contains more moisture and lacks the body of the hard flour. When eight or nine months old, flour is usually at its best. It should be kept in a dry, cool place as it readily absorbs moisture, the gluten looses its tendency and the bread is coarser and heavier. Flour is almost as sensitive to odors as milk, consequently should be kept in a pure atmosphere.

Liquid yeasts made at home seem to be the most generally used and for bread that will keep well will have a clean, sweet taste in the mouth, and yield the most in bulk from a given amount of flour. There is nothing equal to a perfect home-made yeast bread. We add yeast to the flour in order to make a bread that will be light and spongy. Any fluid will penetrate more quickly through a sponge than through putty, and the digestive fluids are no exception to this rule. Bread made with a mixture of flour and water and baked at once would be close and dry and difficult to masticate and digest. Good bread should be of light, spongy texture that the greatest possible amount of surface is presented to the action of the digestive juices. To obtain these qualities we should expand the dough as much as possible without destroying the sweetness. The process by which the expansion is brought about, due to the yeast is one of fermentation.

Yeast is a tiny plant, one of the simplest forms of vegetable organisms in existence. In order to grow it requires a fair degree of warmth, moisture and starch or sugar to feed upon. When placed in the flour, to which some warm liquid has been added, it finds all the conditions necessary for growth and begins at once to reproduce. It buds off in every direction and multiplies into many millions to the cubic inch. It feeds upon the starch, changing some of it into sugar and the sugar into alcohol and carbonic acid gas. This gas, because of the warmth, expands and being lighter than the dough, rises and in its efforts to escape expands the elastic mass. Right here is seen the importance of the gluten. If it were not present the gas would readily break through the walls of the bubbles it forms and escape, and the bread would fall, but because it is present the walls of the bubbles are tough and elastic, will expand without breaking and keep the gas confined to the dough.

We may take it as a general principle that the slower any fermentation takes place the more desirable the product, and this principle applies to bread making. On the farm as a rule, it seems more convenient to set the bread over night, and bread made in this manner is better than bread made in a few hours. It may neither look better nor taste better, but it is more wholesome. Some of the constituents of the flour are made by the action of the yeast partially digested. This is a slow process and in rapidly made bread has not time to take place properly.

"Milk will make a whiter and more nourishing bread than water. Water bread will keep moist longer. The addition of a small amount of shortening will make bread tender. Butter is the most wholesome; lard will make whiter bread. Separate pans for each loaf are advisable, the loaves are better shaped, more evenly cooked and more wholesome. The sweet nutty crust of the bread is partially digested in the process of baking. When taken from the pans the bread should be set where the air can circulate freely around it. An old window screen with cleats on the ends makes an excellent bread cooler."

A common remedy, which has proved effective in poison oak or ivy, is ordinary lard with sufficent prepared chalk rubbed into it to make a thick paste. Apply often, rubbing it well into the poisoned surface. Said never to fail of curing.

Squirrels.—Experiments in Nevada to determine the best method of exterminating these pests proved that Strychnine was the most satisfactory.

ORDERLY HOUSEKEEPING

If a woman is to succeed as a house keeper she must cultivate order from the first. She must make her work a pleasant pastime. Have a place for everything and see that everything is kept in its place. Retiring early at night and rising early in the morning places the housekeeper in advance during the day. Before baking or cooking, much time is saved by having the material on hand and proper utensils to work with. A very helpful system is to time yourself while doing your work. Buy a good article and it will prove to be the cheapest in the end. For eating it will taste better, for wearing it will last longer and look better, and for your house you will take more care of a good article than a poor one. As a rule we do not find a systematic housekeeper in one who is absent from her duties five days out of six, particularly a woman who manages her own house and home and does her own work. Washing early in the week, Monday if a fine day, gives a good start for the week. Then iron and bake on Tuesday. Wednesday is a very good day for cake baking. Go over the house with the carpet sweeper and dust up, wipe off kitchen floor on Thursday, sewing or mending, shopping, visiting or calling. On Friday thoroughly sweep and dust the main part of the house, wash windows, clean cupboards and silver, order in groceries for Saturday morning. On Saturday have a general clearing up and preparing for the Sabbath. Some women have the vague idea that housekeeping is not so ennobling as to be a fine musician or painter or needle worker. Stop nad think if the happiest homes are not where the best housekeeping is done. Housekeeper, feel that you are occupying one of the highest professions on earth and doing as much good in the world and fulfilling the mission that God has given you, as the best temperance lecturer. In fact, if home duties were a little more properly cared for, there would not be so many unhappy homes to-day. Let us aim at making our homes more attractive and pleasant.

Much satisfaction is derived from keeping a daily account of your expenditures and often avoids disputes with merchants. Be moderate in your dress. If you cannot afford all the home comforts and dress too, do without the dress. It is well to have some knowledge of dressmaking and tailoring. One often gets more wear from a made over article than when new. Be a fond, loving mother, but do not spoil your children by not teaching them how to be good housekeepers, modest and obedient.

Systematic housekeeping is one long life-time experience, learning something new every day and keeping in practice the knowledge you have gained in the past. The better way would be to take one subject at a time and thoroughly discuss it. For instance, house-cleaning is one of the important duties of today. Having some experience in that line, I do not favor upsetting the whole of the house at once, but prefer taking one room at a time, commencing at the attic and ending at cellar or back kitchen.—Mrs. A. Beck.

THE CARE OF FINE SHOES

Shoes will wear much longer if they are properly cared for and it is easily done when one knows how.

A little vaseline rubbed on the shoes occasionally makes the leather soft and prevents cracking. Let the shoes stand a while to absorb the vaseline and then rub them well with a woolen cloth.

One of the best liquid dressings for shoes may be made at home with very little expense. By the aid of heat dissolve two ounces of borax and four ounces of gum shellac in a quart of hot water. Some time is necessary for this. Strain through a cloth and while still hot, dissolve two packages of Diamond slate dye in the liquid. Let cool and bottle for use. Apply to the shoes with a swab or sponge or cloth the same as other shoe dressings. Half of the quantity may be made if desired, but as it takes no more work to make the whole at once, and the dressing keeps perfectly, we prefer to use these quantities.

Cookery Recipes

FRENCH PANCAKES

Use any good pancake batter, except buckwheat, and bake in small, round, thin pancakes. Spread with jelly or jam, roll up, sprinkle with powdered sugar, and serve hot.

APPLE COBBLER

Peel and core eight medium-sized apples. Arrange in a baking dish, and fill the cores with sugar. Make a batter with three cupfuls of milk, three ounces of flour and four eggs, well beaten. Pour over the apples, and bake until the fruit is done. Serve with any preferred pudding sauce.

CHOCOLATE PUDDING.

Half a pound of stale bread crumbs and milk to make a smooth paste when boiled. Add a heaping tablespoonful of cocoa, sugar to taste, and a few drops of vanilla. Take from the fire, and add three eggs, beaten separately, first the yelks and then the whites whipped to a stiff froth. Put into a buttered pudding-dish and bake carefully. Serve with cream, either whipped or plain.

FRUIT PUDDING.

One cupful of milk and one cupful of canned fruit juice. Add two tablespoonfuls of powdered sugar. and bring to a boil. Remove from the fire and stir in quickly the well-beaten yelks of four eggs. Butter a pudding dish, and put in a large cupful of canned fruit. Beat the whites of the egg to a stiff froth, stir into the custard, pour over fruit, and bake half an hour. —Modern Women.

DRY CLEANED BLANKETS.

A writer in the household attacks the idea of dry cleaned blankets in the following manner

The idea of dry cleaned blankets no longer holds good and we women who go in for health and hygiene have them washed and then dried in the open air and sun. Germ life exists for many months in the fleecy surface of woolen goods, hence it is not safe to dry clean woolens. I will give you my dear old colored laundress' method of washing blankets, and she certainly kept the blankets soft and clean. She selects a bright, clear, sunny day to wash them, as it is very necessary that both washing and drying process be hurried along as quickly as possible. If the blankets are heavy and large two persons can do the work better than one. Fill a tub full of rain water, warm, but not hot, and make a good suds using white soap and add two tablespoonfuls of Pearline into the suds to hasten the work. Rub gently, putting one blanket in at a time, never use a washboard but rub with the hands until all soil is gone. Send them through a second suds of the same temperature as the first, then rinse and send through a rubber wringer if you have one. Put a little borax in the rinsing water and have it warm. Dry quickly in the sun. When thoroughly dry, fold smoothly and place them under a weight a day or two. then they are ready for use and like a new blanket.

EXTRAVAGANCE

Bill—"Say, John who's the most extravagant person you know?"

John.—That's easy. It's my wife, Sallie."

Bill—"No. It's Tom Allen. He blowed in a hundred dollars this spring just for nothing."

John—"You're jokin'. Sure Tom never spent a cent foolishly in his life."

Bill—"Well, there he comes now and I'll leave it to you. See that horse he's driving. That's that six year old mare I sold him this spring for $250., and she was worth it but he let her get bad shoulders and she ran right down till now you, nor me, nor no one else wouldn't offer more than $150.00 for her, and if that isn't extravagant to knock a hundred dollars off the value of a mare when 25 cents for a box of Security Gall Cure would have saved it, then I don't know what extravagance is."

Many a man thinks he is in love when he merely has fatty degeneration of the heart.—Pacific Monthly.

THE MARK AND THE MOTTO

"The Recollection of Quality
Remains Long After
The Price is Forgotten"

Trade Mark Registered.

E.C. SIMMONS KEEN KUTTER TRADE ST. LOUIS MO. MARK

The difference in *worth* between a good tool and a poor one is always more than the difference in *cost.* Counting the time wasted in constant sharpening and the short life of inferior tools, a poor tool is really more expensive than a good one.

Whenever you need a tool of any kind, it will pay you to buy the Keen Kutter brand, and have the best. All kinds of tools are made under this name, and every kind represents the very highest quality of material, workmanship and finish.

KEEN KUTTER

tools have been the standard of America for 36 years and are the only complete line of tools ever to receive an award at a great exposition—the Keen Kutter line being awarded the Grand Prize at the St. Louis Fair.

Following are some of the kinds of tools made under the Keen Kutter Brand: Axes, Adzes, Hammers, Hatchets, Chisels, Screw Drivers, Auger Bits, Files, Planes, Draw Knives, Saws, Tool Cabinets, Scythes, Hay Knives, Grass Hooks, Brush Hooks, Corn Knives, Trowels, Pruning Shears, Tinners' Snips, Scissors, Eye Hoes, Shears, Hair Clippers, Horse Shears, Razors, etc., and knives of all kinds.

If your dealer does not keep Keen Kutter Tools write us and learn where to get them. Send for Tool Booklet.

The Produce Markets

Los Angeles Markets.

Los Angeles, March 15, 1906.

Trading at the produce market yesterday was of increased volume as result of the clearer weather, but the improvement was hardly up to expectations. and with supplies equal to requirements, prices were without important fluctuations.

Receipts of local ranch eggs were the largest of the season yesterday. showing a total of 807 cases. There was considerable doubt among the eggs jobbers as to whether the total receipt of 807 cases were all strictly ranch offerings; the rumor circulated being to the effect that over 400 of the cases received were more than likely a carload of eastern storage that might have stolen in unannounced. The market was quoted firm at 19c.

Butter arrived in heavy shipments, also. showing a total of 27,115 lbs. The general undertone was steady, without any changes in the quotations.

Receipts of vegetables were extremely light on account of the rain.

Followin~ are the jobbing prices in the Los Angeles market.

Butter.

CITRUS MARKETS

Below we give, as in the past, the reported Eastern sales of California citrus fruit, for the last day before going to press. Those interested in general market conditions for the past week or ten days will find a perusal of this week's citrus page most profitable. The general market conditions remain, as for several weeks past, first class, and all Eastern cities show an increasing demand for our citrus fruits, the consumption in New York City far surpassing that of any previous year.

NEW YORK, March 13.—Thirty-four cars were sold at auction today The market is declining. The weather is favorable.

Silver Spangled Hamburg's eggs and stock are advertised this week by Arroyo Verde Springs, So. Pasadena, Calif.

The American Steel & Wire Company. Chicago, Ill., are sending free to all farmers and ranchers a copy of their publication "Fence." If interested in any kind of fence write them for a copy, mentioning the Cultivator.

The old established R. F. Wilson Manufacturing Company., of Stockton is again before the Cultivator readers with its talk on windmills and tanks. Mr. Wilson is admirably situated as to securing lumber supplies and can give attractive figures on tanks and mills.

The Sivert Oil Burner Co., finds these busy days with putting in the popular burner. Oil is vastly cheaper than other fuels and the Sievert gets the heat out of oil as few other burners do.

The recent purchase of the G. G. Wickson Dairy supply Houses of the Coast, San Francisco, Los Angeles, and Portland, by the De Laval Separator people brings a new factor into the field, excepting in San Francisco where the De Laval people have been for some time. This enterprising firm is refitting the old Wickson places and will place new stock and be prepared to give better service than ever. The manager of the Los Angeles house is Jas. I. Sedgley.

Willow Brook Farm, of Berlin, Conn., issues a neat booklet on Orpingtons, Buffs, Blacks and Whites. A postal will get it.

The sulphuring time for vines, and spraying time for trees, calls for a place to secure a high grade of sulphur. Cheap sulphur is poor stuff. A good sulphur may be secured from the old reliable San Francisco Sulphur Company., 318 Front street, San Francisco.

IT'S PENNY WISE

Policy to set out a good tree, costing good money and then let the sun burn the bark, or the rabbits gnaw it when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Mfg. Co., 2124 Willow St., Los Angeles.

IWANS' POST HOLE AND WELL AUGER

Best earth auger in the world. For Fence and Telphone Post Holes, Wells, etc. Three times the work accomplished with an Iwan Auger than with any other. Makes hole smoothly and quickly; empties easily; is very durable. Us d by U. S. Gov't. 3, 4, 5, 6, 7, 8, 9 and 10 inch, $2.50 each; 12 inch, $6.00; 14 inch, $7.50. Sample at special price to introduce. Agents Wanted. Inquire of dealers or write direct for particulars. IWAN BROS., Box. A Streator, ILL.

CANCER

IN WOMAN'S BREAST
ANY LUMP IS CANCER

Mailed Free—How to Cure Yourself if Cancer is Yet Small—No Pain.

NO PAY UNTIL CURED—GUARANTEE—
JUST SEND YOUR NAME

MRS. E. CROSTHWAITE,
954 Arlington Ave., Oakland, Cal.,
President Golden Gate Woman's Club,

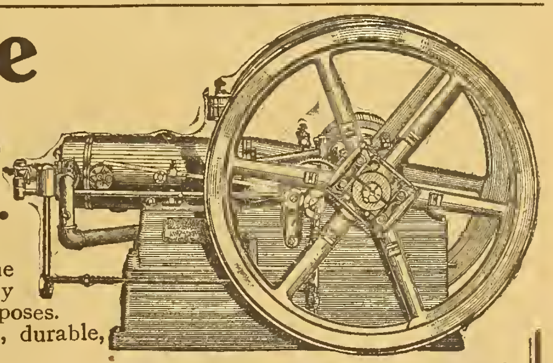
Dear Dr. Chamley—I will state, your medicine cured a very large cancer in my breast 11 inches long, extending to my side and armpit in 14 days over 5 years ago. WRITE AND ASK HER. *Don't doubt, don't delay.*

Mrs. A. L. Bailash, 332 Ohio Street, Vallejo, California, was cured at home of breast cancer; also her mother cured of cancer in both breasts. WRITE TO THEM. E. J. (Lucky) Baldwin, Arcadia, Cal., writes: Dr. Chamley cured a large cancer on my lip and two in my throat after X-Ray and other Doctors had failed. I will give $1000 if I fail to cure any cancer or tumor I treat before it poisons deep. You can't afford to make mistakes with Cancer. Life is surely worth sending your name. 130-page book sent free.

My discovery—a Pacific Island plant extract—has cured thousands of Cancers in from 10 to 20 days, after celebrated physicians and surgeons had declared them "as good as dead."

Address, Dr. and Mrs. Dr. Chamley & Co.,
25 Third Street, San Francisco, Cal.
KINDLY SEND THIS TO SOME ONE WITH CANCER

Gasoline Engines For Irrigating.



THE I. H. C. Gasoline Engines are especially adapted for irrigating purposes.

They will be found safe, durable, simple, and economical.

With maximum power, they can be operated at a minimum expense.

Expert knowledge or previous experience not required to operate them.

They can be attached to any kind of pump in any position, for raising water from deep or shallow wells, reservoirs, canals or running streams.

They excel in **full, regular and long sustained power.**

They can also be used for a general purpose engine for sawing wood, churning, cream separating, feed grinding, etc.

They are unequaled for power of all kinds.

Made in variety of sizes and styles:

Vertical—2, 3, 5 Horse Power.

Horizontal—(Portable and Stationary), **4, 6, 8, 10, 12 or 15 Horse Power.**

An engine of this description, with a suitable pump, makes agriculture a success where it would otherwise be impossible.

Call on local agent and examine these engines or write nearest general agency for illustrated catalog.

WESTERN GENERAL AGENCIES: Denver, Col., Helena, Mont., Portland, Ore., Spokane, Wash., Salt Lake City, Utah, San Francisco, Cal.

A Few Remarks About the Care of Chicks

By W. G. Aldrich

Select your eggs from strong, mature matings, as free from contagions as possible. Then incubate as near right as possible, as it is an easy matter to ruin your chicks by improper treatment during this period; don't crowd, or try to improve your machine, but adhere strictly to the instructions.

When your hatch is done, kill all the cripples and drags, as they are no good and are a nuisance to the others. This should be done as you remove the chicks to the brooder.

TEMPERATURE OF BROODER

Most people heat to 90 degrees, but I prefer only 80 to 85 degrees. Then look to the comfort of the little ones, just the same as you would to a child. I start to feed with charcoal and fine grit about 12 to 15 hours after the hatch is done. by throwing it loose in the brooder. Then in about 12 hours more, start with Coulson's Special Dry Ready-Mixed Chick Feed, in a litter of cut straw; keeping clean, fresh water constantly at hand.

Then the first consideration is cleanliness, which is the keynote to the Poultry Industry from "A" to "Z". Old and true is the saying: "Cleanliness is next to Godliness." It certainly is in the chicken business.

CONSIDER THE HEAT

The regulation of heat is the regulation of comfort. Strive to keep the little ones contented. People are apt to overdo the heat, and keep the brooders TOO WARM at night; not so in the daytime, as the chicks are out and in all the time. But at night the birds themselves, maintain the warmth in the brooder, but as soon as they leave the brooder in the morning, it cools off. Then the heat must be turned on early, because if the chicks return to a cold home, they will crowd together, and pile up, in their efforts to get warm. and then look out for trouble. At night turn the blaze of the lamp down real low, just low enough so it don't go out. Then the first thing in the morning when you get up, go out and turn up the blaze, so as to warm up the brooder; so that it will be warm enough to be comfortable for the chicks; say about 85 degrees. By experience one can tell by placing the hand in the brooder, whether it is comfortable for the chicks or not.

In the rainy season I keep my brooders warm all day, even until the birds are quite feathered, but put out the blaze about half past four or five o'clock, before the chicks go to roost at night, so as to let the brooders cool; because if they find it too warm, they will not go in, and in case they do stay outside, they will get too cool. Before morning, they take cold, contract Roup, get sick, and die off, or droop around and make no growth. They must be kept in comfort or they will not do well, and will not thrive as they are expected to do.

ALWAYS GET THE BEST

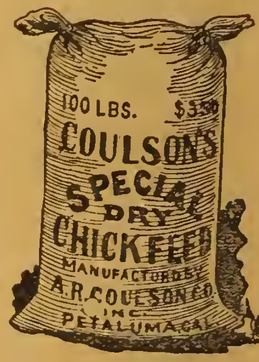
Do not try to be too cheap; get good feed (Coulson's Special Dry Chick Feed), good oil, disinfect often; do not let expense stand before comfort. (A good disinfectant to use is Coulson's Lice Killer, sprayed with an Atomizer Spray Pump.)

No matter how good and strong your little chicks are today, tomorrow may see them off wrong, without any apparent cause, but there is a cause, just the same. Perhaps, worms have attacked them, so give them a little Coulson's Roup Cure in the water, about four to six drops to each quart; start when they are three days old, and continue for three weeks. Along these lines you raise around 75 to 80 per cent of them.

People will find that different lots of chicks will require a little difference in temperature, but strive to keep them comfortable; be sure to keep them clean, and the rest is easy.

MORE REMARKS ABUOT THE FEED

Feed the Coulson's Dry Chick Feed four or five times a day for the first ten days; after they are two weeks old, feed them one meal a day of Coulson's Growing Chick Feed, and three times with some of Coulson's Special. When they get to be two months old, feed Coulson's Growing Chick Feed, by wetting it with milk or water, to make a mash food and feed cracked wheat or whole twice a day. When they are three months old, they can be fed the same as the hens, Coulson's Egg Food, in the morning, and wheat and other grains for the other meals.



One Cent

a chick is all that it costs to feed the chick the first 25 days on Coulson's Special Chick Feed. Ask your dealer for it.

Vol. XXVI—No. 12 LOS ANGELES, CAL., FRIDAY, MARCH 23, 1906 Subscription $1 a Year

Street Trees--Systematic Planting and Care

By Ernest Braunton

In answer to many requests from individuals and improvement societies, for a comprehensive article on street tree planting, we publish the following valuable treatise on the subject, and trust that those interested will preserve a copy for further reference; it will save you asking questions and remove the necessity for the Cultivator's publishing it piece-meal through-out the year in answer to "Anxious Subscriber."

There are many minor reasons for planting street trees, but the chief or fundamental ones are about four in number, as follows:

1. For ornament; 2nd, for health; 3rd, for comfort; 4th, for protection.

1. Street ornamentation pays didectly in dollars and cents. Beautifying a neighborhood is not a mere fad. It costs but little more to make it attractive than to leave it or make it unsightly, and a well kept, well planted district will not only attract but command residents desirable in every way. It is not mere sentiment that prompts the railroads to advertise the attractions along their lines. Beauty to them represents cash, and each year they spend immense sums calling attention to the attractions of the sections through which they pass. If people choose a line of travel because of its natural and acquired beauties, how much more eagerly will they seek such a place for a residence. That both are eagerly sought for is undisputed. Landscape beauty is capital. Again, not one of us would be satisfied to spend his life in a desert, though surrounded with the necessities of life in plenty. Our natures crave better and more beautiful surroundings, and we oftimes travel far seeking the most beautiful location obtainable.

2. Street trees add greatly to the healthfulness of any district by cooling and purifying the air, the foliage evaporates large quantities of water and the reduction of temperature in this way is greatest during the hottest and dryest weather. The foliage also absorbs impure and therefore harmful gases. Trees also promote circulation air (due principally to unequal temperature.)

3. Street trees add materially to comfort either in city or country, not alone to shade the passer-by, and the idler who rests beneath their branches but in a climate like ours, with perpetual sunshine, they soften the glare and heat of sun on sidewalks.

4. All will concede that street trees afford protection from both wind and sun, but as a protection against fire they are not so well known. The chief of the San Francisco Fire Department states that shade trees in sidewalks are beneficial in checking the spread of fire. First, they are good as windbreaks, keeping sparks and cinders from nearby buildings. Second, they shield the houses, preventing them from catching fire from the heat. He tells of a fire where a single large tree prevented the destruction of a three-story flat adjoining. In this case there was considerable delay in getting water, so that the fire gained great headway.

From a financial point of view, alone, the systematic planting and care of trees on streets would prove a paying investment. Many cases are known where bare land of superior value has sold at a much less price than inferior land with the frontage aligned with street trees. For all purposes but the growing of crops street trees are of more importance and value to the land than quality of soil. New comers are not attracted to a city by garish, shadeless streets any more than they are by dirty or poorly paved streets, unsanitary conditions, or other forms of slovenly civic housekeeping.

Nearly all streets and highways are planted with several sorts of trees to each block, of every conceivable size, form, color and degree of desirability. Such planting looks as irrational as an orchard of all sorts of fruit trees hopelessly mixed—oranges, peaches, walnuts, persimmons, olives and pomegranates, a genuine horticultural museum, planted for the curious only. Prof. Waugh, in his work on landscape gardening says such street planting reminds him of nine monstrously different buttons down the front of a Prince Albert coat.

"Gardening in California" says: "There is one feature in the planting of street trees that calls for special attention. This is the reprehensible practice of planting a jumble of sorts upon the same block. Not only is the effect as a whole bad. but the individual beauty of each is lost in the kaleidoscopic shifting of form and color, that only serves to confuse and bewilder the passer-by.

Very little can be done toward uniform planting without zealous and well directed co-operation on the part of all interested. There must be unity and intelligence of plan, and the work should be carried on by farmers' clubs and improvement associations, those necessary organizations which "do not presume to tell the community how it should spend its money, but only how it may get, with efficiency, the greatest amount of sightliness for its money."

It is of the highest importance that that a plan be outlined on which people of diverse tastes and interest can either agree or effect a compromise. It will not be impossible to find a tree which all may finally adopt, for the vast majority of people desire above all things that their neighborhood should be attractive, and will yield somewhat in their opinion in order to obtain desirable results. We must learn to sacrifice some things in order to get others of different tastes to co-operate with us. It is best, perhaps, after a thorough discussion of the merits of the different trees, to put the matter of selection of one for each street to a vote and let the majority rule, not forgetting that this is a matter which concerns the general public more than the individual.

In incorporated cities the best solution of the matter lies in the adoption of a street tree ordinance. This measure is one of compulsory street planting whereby all streets in the city must be fully planted within two years. It is left with the council or trustees to choose an official tree for each street, but the property owners have the right of petition in the matter, and the tree desired by the majority has invariably been designated as the official tree. Every street must choose its tree within six months after the passage of the ordinance and if not planted accordingly within two years, the city does the work and charges the expense against the property, along with the city taxes. Only in this way may all non-resident owners be made to respond. The results have been highly satisfactory, exceeding all expectations. This ordinance does not require removal of existing trees.

The most common mistake made is the lack of preparation. All holes, no matter in what soil or what the size of the tree, should be dug from 3 to 4 feet deep and of the same diameter. Fill this hole with the best soil to be had, putting the very best at the bottom, below the roots. The tree finding better feed below than above will develop a deep root system and we will not then find so many dying trees nor so many heaved and broken sidewalks.

When buying stock get free-rooted and vigorous trees, not stunted ones. Better plant a thrifty one six inches high, than one as many feet whose roots have been confined for two or three years in a pot or can. Usually too many trees to each lot are planted. Two trees on a 50 foot lot are plenty, and one would be better.

Some sections have found it desirable to have deciduous trees and the argument in their favor consists of the fact that they allow a maximum of sunshine in winter and give abundant protection from it during the summer. But in California we can always get plenty of sunshine and unless the location is such that too much mud or dampness will be produced, I prefer evergreens.

"Evergreen" is not meant to cover conifers or cone-bearing trees alone, as the word is used in the east, but just what Webster says it means: any tree which retains its leaves through-out the year. Conifers, by the way, are unfitted for roadside planting except on avenues of unusual width, where 20 to 30 feet may be allowed for them, either along each side of through the center.

The author of "Gardening in California" says: "Conifers are frequently used for street planting, but language is not strong enough to condemn the impropriety of their use for this purpose. Public convenience demands the removal of all lower branches for a height of eight or ten feet of trees that align sidewalks or public highways. As the exquisite beauty of most conifers depends largely upon the integrity of their lower limbs, the impropriety of planting any tree subject to these requirements becomes apparent."

The same may be said of all cone-bearers and many others upon private premises. Trees of pyrimidal growth should be allowed the whole of their natural support.

Those wishing a deciduous tree should use for wide thoroughfares the Spanish chestnut, one of the grandest shade trees known; for a medium tree, the pecan; for a still smaller growth, the Texas umbrella. Another first class deciduous tree of medium size is the oriental plane (Platanus orientalis).

Our native live oak (Quercus agrifolia) easily stands first on the list of

Continued on Page 282

Part of Flock of 500 Indian Runner Ducks bred by H. M. Warren. Santa Cruz.

THE DUCK THAT BEATS THE HEN

What Indian Runners Will Do—By H. M. Warren.

Little has been said in poultry journals about the famous Indian Runner Ducks. As layers, these ducks lead the world. In all legitimate contests they stand at the head. Experiments have been made in England and America for several years, and a conservative estimate places their average at 200 eggs each per year. I have had them lay 229 eggs in a year. My flock of five hundred birds will easily average 200 each per year.

The fact that they are prolific layers is not the only point to be taken into consideration. It must be remembered that they are immune from disease and vermin, and require little or no housing.

Nor is it at all essential that they should have an abundance of water to swim in. A drinking fountain is all they require.

They are inveterate foragers, and thrive best on free range, a two-foot fence being all that is necessary to keep them within bounds.

When these birds have reached a marketable age (10 to 12 weeks) they have nearly attained their growth. and have little to do but to complete their plumage and commence laying. They lay as early as a Leghorn pullet. but lay much larger eggs and a great many more of them. They are quite unlike other duck eggs, being of a fine delicious flavor, differing very slightly from hen eggs.

I find them the ideal duck, easy to raise, excellent layers, fine table fowls, juicy and fine grained, require no running water, bear confinement well, are good foragers, eat very little more than a hen and are better suited to California climate than any other domestic fowl.

Indian Runners have come to stay. They have passed the experimental stage, and I believe the time is not far distant when the hen will be relegated to the rear, only to be superseded by her world-renowned rival—the Indian Runner Duck.

Deciduous Fruit Culture

BY J. W. MILLS, POMONA, CAL.

FERTILIZER FOR VINEYARD

Editor Cultivator—Please state in your paper what chemicals are best suited as a fertilizer for a vineyard and what proportion. Land is gravel. A. H. D., Etiwanda.

We cannot tell you what chemicals to use on a vineyard which is planted in gravel. No chemicals will give desirable results on such land. We have not much faith in artificial fertilizer unless there is plenty of humus in the soil. We would advise using stable manure; let the weeds grow and plow them under.

FERTILIZERS AND BUSH FRUIT

Editor Cultivator—Will you inform me and others interested, how to get cranberry roots, as I wish to plant a few for family use in a boggy place on the mountain where we live?

What is the value of unleached ashes per bushel; also that which has been exposed to the weather for two or three years? What are well rotted fertilizers from the horse barn worth per cubic yard; also those from the cow and chicken yards?

Where can I get roots or cuttings of the black, white and large red currant? A. E. M., San Diego, Cal.

We would suggest that you write to the Director of the Agricultural Department of State University of Maine for information about cranberry roots. Any of the San Francisco or Los Angeles seed and plant companies ought to supply you with currant roots. They advertise in this paper.

There is no way of telling what stable or any other kind of manure is worth until you get an analysis of it. The value of the fresh varies with the kind of feed given the stock. That which is leached by rains varies again with the rains, the amount of water that has run through the manure. Orange growers are in the habit of paying from two to four cents per cubic foot for stable manure.

Ashes vary as much as manure. The hardwood ashes contain more mineral matter than those from soft wood. If coal ashes are mixed in the value is much reduced. If the ashes are leached there is no telling what they are worth unless you have an analysis made. We would not care to give over $4.00 per ton for ashes, not knowing the amount of potash and phosphoric acid they contain.

Hen manure is worth about $6 per ton if kept moist, never having been allowed to dry out. If it has dried at any time the silica solidifies and encases a large part of the mineral salts and renders them unavailable and so reduces the value.

WORM EATING CANTALOUPE SEED

Editor Cultivator—There has appeared in this locality a small white worm that attacks the cantaloupe seed just as it begins to sprout. It appears to be almost entirely confined to ground upon which corn has been raised, although some report it on new land. Will you kindly let me know through the columns of your valuable paper as to the remedies, if any, and how to apply; also if it has appeared in the other cantaloupe-growing sections. J. H. S., Brawley.

Our attention has not been called to this pest before. We know of no practical remedy for destroying the worms without also destroying the plants. If we knew the habits of the worms we might know what to do. We suggest clean culture between cantaloupe crops for a couple of years. A parasite will catch your worms after a while.

SUGAR CANE

Editor Cultivator—Please let me know through Queries and Replies where I could get sugar cane roots or seeds. I have never seen them advertised so don't know where to get them, having seen your article, "California Sugar Cane." I hope you might be able to tell us. J. C., Anaheim.

We suggest that you write to Mr. Alexander Craw, at Honolulu. He will no doubt take pleasure in sending you a few joints. The "California Sugar Cane" we illustrated was grown by B. W. Lewis, at Corcoran, Tulare county; he may be able to supply you.

PROPAGATING PEAR TREES

Editor Cultivator.—I have one pear tree only, but it seems an unusual one. It is 17 years old, quite small, but bears a heavy load alternate years and a few every year. There has never been any blight, nor a wormy pear; has borne for probably 14 years. The pears are large, fine; taste like Bartlett, but are I think later than Bartlett. Can I set out the sprouts that came up at roots and later bud from the same, or can I plant the seeds and bud the plants. What is the pear? Yours truly, L. U. S., Glendora.

We would not advise you to plant sprouts that come up from the roots as such stock will continue to do likewise and cause you much annoyance. It will pay you to purchase seedling pear trees from some nurseryman and bud them. If your tree is a seedling, you will, of course, get the same kind of fruit on the sprouts which you would transplant, but if your tree is a budded tree you will get something else. You may plant seeds and bud the plants, but the stock may be inferior. There is a hardy pear that is grown expressly for stock that has been tested and found to be the best. It is handled by all deciduous fruit tree nurserymen. We cannot tell you the name of your pear. If it is a seedling, it is waiting for a name. No doubt Mr. Geo. C. Roeding, of Fresno, would recommend you as a competent person to give it a name. Your description of it would indicate that it is worthy of a name.

WALNUT BLIGHT

The following recommendations relative to the prevention of Walnut Blight or Bacteriosis are based upon several years of careful experiments by the United States Department of Agriculture. They are given to enable the growers of walnuts throughout the State to take advantage of the work of the Department on this disease so far as the experiments have progressed. The following treatment will reduce the loss one-half.

1. All infected trees should be pruned carefully to remove branches showing the action of the disease of the previous year. Remove the dead tips of limbs, especially those of last year's growth, cutting well back of the diseased parts. Also cut away small limbs which show the blackened scars of the past year's disease, where the organism causing the disease winters in the pith cavity. Burn all prunings.

2. Spray the dormant trees thoroughly with the Bordeaux mixture. This work will give the best results if done some two weeks before spring growth begins. All portions of the tree should be treated, special attention being given to the wood of last year.

3. Spray the trees a second time as soon as the nuts are firmly set, using the same spray and making a special effort to treat the young nuts upon all sides. The object is to protect the nuts from infection.

4. Prepare the spray as follows:

5 pounds of copper sulphate.
5 pounds of good quick lime.
50 gallons of water.

(a) Slake the lime in an oak barrel in a small amount of water. When perfectly slaked, add enough water to make 25 gallons of milk of lime.

(b) Thoroughly dissolve the copper sulphate in an oak barrel containing 25 gallons of cold water.

(c) Continue to pour one pailful each of the milk of lime and of the copper sulphate solution simultaneously into a third oak barrel, holding 50 or 60 gallons, until all of the two solutions are thus united. Stir the milk of lime as it is dipped out and pour it through a fine wire strainer into the mixing barrel.

(d) When the mixture in the third barrel is well stirred it will be ready to apply as a spray to the trees. Spray the trees while the mixture is fresh and stir the latter occasionally.

(e) The spraying should be done if possible when there is little or no wind.

(f) Use a spray pump which will maintain a pressure of 120 pounds or more, and such nozzles as necessary to reach the highest limbs and do the best work over all portions of the tree with the least waste of spray.

Practical Farm Science

BY PROF. A. J. COOK

BEET CULTURE IN GERMANY

I have been investigating as thoroughly as I am able the methods of beet culture in Germany; that I might compare them with ours in the United States. They plow deeper than we do. They plant closer and cultivate more carefully. They depend almost wholly on stable fertilizer for humus, as such manure is cheap and easily secured, and use far more commercial fertilizer than do we in America. They practice what we believe, in reference to deep plowing. They think they add to the sugar content by close planting; they say the land must be kept mellow by frequent cultivation, and that weeds must not be permitted to rob the soil and crop of the needed soil elements. Hand labor is so cheap here that often it largely supplants horse culture. As yet they do not plow under "green crops" to any considerable extent. They hold to old-time practices of using barn yard manure. They have learned from trial that commercial fertilizers, superphosphates and soda nitrate pay a great profit on their cost, hence their more liberal use of such fertilizers.

* * *

EXTRACTED HONEY

This is honey thrown out by centrifugal force or the honey extractor. It is not strained honey, but a far different and more desirable article. Indeed it is just the same as comb honey, only here the wax of the comb is not present. We have simply the liquid honey with no comb to accompany it. As comb is wholly indigestible this extracted honey has the same nutritious contents as does the same amount of honey in the comb. The comb serves two purposes; it makes honey as a table article more attractive and it acts as a diluent, and as we thus get the honey in a little less concentrated form we do not eat it so rapidly. and so tire of it less quickly; especially if we are not vigorous and possessed of a workman's appetite.

For California, and any country far distant from market, extracted honey is especially worthy the attention of the bee-keeper. It is easier to ship and is in a safer form for shipment than is comb honey. It is also easier to secure a good crop and the beekeeper may hope to succeed with less of skill. One can produce extracted honey in California with surety of a profit if he can be assured six cents per pound. While in case of comb honey he must get ten cents to do so well; some say 12 cents or twice as much. It has been the desire of beekeepers for years, to breed a race of bees with the swarming instinct reduced to the lowest possible point. They wish the full energy devoted to honey production and not to increase of colonies. In the production of comb honey, this is very important; in the securing of extracted honey, the beekeeper easily controls the swarming tendency, and so here is another decided count in favor of working for extracted honey .

There are a few Golden rules for the California beekeeper to observe in this quest of large harvests of extracted honey. He must not extract too close so as to leave the bees too scant of stores at the end of the season. He must be sure that his bees have sufficient honey in the hives that none will starve. This is especially important in view of years of drouth and no honey production. It is also more to be guarded against when we extract than when we work for comb honey. It is so easy in our extracting near the end of the season to extract too closely. We must be very careful that our bees never lack honey sufficient for their own maintenance, and best energy, and we must see to it that they are strong and in the best heart at the dawn of the honey season. This may require us to feed to stimulate as the honey season draws nigh. Another very important caution has reference to unripe honey. We must never extract till the honey is mostly capped over. Then we shall be sure that it will be thick and excellent. It is so much easier to extract before the honey is capped at all, as then we are saved the labor of uncapping, and the thinner condition of the honey makes it easier to throw it out, so that there is ever the temptation to this premature extracting. Yet the honey thus secured will never be of high grade, and such practice not only injures the beekeeper himself, but all beekeepers, as it hurts the reputation and demand for honey.

NITROGEN-FIXING BACTERIA

The extravagant and misleading claims contained in some of the advertising matter now appearing in legumes make it necessary again to call attention to the limitations of the value of inoculation. Summarized from our bulletins, they may be stated as follows:

No beneficial results can be expected for a particular crop if the bacteria for that crop are already present in the soil.

But little, if any, benefit can be expected from the use of these bacteria if the ground is decidedly in need of other fertilizers, such as prosphates, potash or lime.

But little, if any, benefit can be expected from inoculation if the soil is already rich in nitrogen.

The Analey Standard' reports the hop growers of Sonoma county as rejoicing over the great saving they are making in the purchase of supplies this year. Besides a saving of fully 50 per cent on the annual insurance, the exchange has arranged to secure hop cloth and twine by the carload lots for the members at a saving of 25 cents a bale for the cloth, or $2250 saving for the year's supply for the crop. The saving on twine is about in proportion. One grower states that in insurance, cloth and twine he will make a saving of fully $150 on his crop of 5000 bales.

Representative McKinlay and other backers of his bill giving permission for diversion of Sacramento River waters in Tehama county for irrigation of 200.000 acres of land in Glenn county and vicinity are anxious to have the measure referred to the House Irrigation Committee. Mr. McKinlay says the bill ought to pass, and the entire California delegation supports him.

After each rain the soil should be well cultivated—it may be the last rain of the season—see that the soil moistured is conserved.

FROST PREVENTION.

Editor Cultivator: Will you kindly tell me of the best modes employed for prevention of frosts? A number of us are anxious to know how we can save our apricots from frost, and think an article on the subject would be greatly appreciated.—J. L. M., San Jose.

It is doubtless too late to be of great value for this season to make a regular article on frost prevention, which has been treated in the Cultivator extensively heretofore. but to get the latest information on the subject we wrote to Mr. James Mills, of the Arlington Fruit Company, Riverside for a short statement of his latest experience, and he replies as follows:

"Replying to your favor of March 13th, regarding inquiry from a subscriber in San Jose, touching frost prevention, I beg to say that we have been using for three years, when necessary, the smudge material, manufactured by Geo. Griffiths who resides at 1023 S. Broadway, your city. We first used this in the form of "briqnetts." We found, however, that it was very hard to light and hard to keep burning when used in this form. Mr. Griffiths is now manufacturing his material and sacking it instead of making it up into hard bricquetts. This material we can easily handle in the orchards and we burn it in sheet-iron smudge stoves, that is a circular vessel 14 inches in diameter, 12 to 14 inches deep, perforated with many holes to give a draft and with a little chimney running up the center. This stove will contain about one-third of a sack and when properly pressed will burn from two to three hours. The material thus used is easily lighted and burns freely without attention. The stoves are also very easily and quickly refilled if required during the night. Two men can take care of 20 acres. We light them with torches and use in addition a little coal oil. The man carries a gallon can of coal oil, a little of which he pours on to the smudge material and then touches it with his torch then moves on. The smudge material quickly ignites and burns splendidly, giving a great deal of heat and clouds of smoke. I do not know of anything that will answer the purpose better than Mr. Griffith's material. Given a sufficient number of stoves and enough material, I see no reason why the orchard and fruit canot be saved at any temperature we may possibly experience. In a few low places we have used a hundred stoves to 10 acres. If the stoves were doubled the cost would not be prohibitory providing of course the trees were saved.

I know of no other methods that are superior to this one for prevention of frosts. Running water is very helpful. The trouble is that all affected can not have the water when needed. No water system can possibly furnish water to all of its users at the same time. Yours truly—James Mills, Supt. A. H. F. Co.

ENDING THE SEASON'S PEAR BLIGHT WORK

Prof. Waite and his assistants from Washington, have concluded their labors in California for the present season and have returned to the East, to take up work in other lines. Prof. Waite will probably come to California again about the pear ripening time to see how effective the work has been in the sections where it has been done, and may be with us again next winter. The whole object of the past work has been to make a demonstration on a large scale of the efficacy of Prof. Waite's method of cutting out the hold-over blight, for this purpose infected sections have been selected and the work done thoroughly. It remains for the coming season to show all that is expected from it, then next winter should see every particle of the blight removed from the pear orchards of the state, and after that a careful watch kept to check it as soon as it is seen. By these means we may hope yet to save our important pear industry.

IRRIGATION IN ITALY.

In northern Italy the construction of canals and aqueducts for irrigation is being pushed on a large scale, and the irrigated areas are constantly expanding. Yet Italy has no greater need of irrigation than any state in the American union.

Seeds of tender annuals may now be sown with safety.

A BIG PEA IN A BIG POD

Lilly's Mt. Rainier early Pea is dark green in color, and always fills the pod with plump, luscious peas.

The Mt. Rainier has been perfected in our own experimental gardens on Puget Sound.

It is the finest early pea ever offered to the public and is absolutely reliable and a sure producer because it has been adapted to Pacific Coast conditions.

Its sweet delicate flavor and dark green color make it a favorite with high class hotels and restaurants.

The Mt. Rainier's enormous productivity and the high price it always commands renders it extremely profitable for market gardening.

The vines grow two to three feet high and should be supported to give the best results.

Lilly's Mt. Rainier is a superior pea for canning purposes. Its deep green color withstands the canning process perfectly and it is as vivid and inviting as the best grade of imported French peas, most of which are colored artificially.

The market gardener and any person fond of peas should try the Rainier this season. It is a little better than the best pea you ever tasted before.

Order now. Prices: Pckt. 10c. ½-lb. 20c. Lb. 35c prepaid. By express or freight at purchaser's expense. Lb. 25c. 10 lbs. $2.00. 100 lbs. $15.00.

BY J. W. MILLS

METHODS

Every now and then some man engaged in the same business as hundreds of others, makes more money than his fellow business men even tho' he has the same market and his goods are no better. All conditions seem to be the same and the same advantages seem to be open to all alike. The other day we had occasion to notice these things in conection with orange growing. There were three concerns that illustrated the peculiarities of trade. We will call these concerns A, B, and C. They all grow, pack and ship their own fruit. A raises a fine grade of Valencias and a rather poor grade of Navels. B raises as fine a grade of Navels and Valencias as A. C raises better Navels than either of the other two. A has built up a reputation on his Valencias and sells his at a higher figure to the same wholesaler as does B. It has puzzled and aggravated B to think that the same wholesaler should make the distinction when it is evident to both of them that there was no difference in the fruit. The wholesaler defended himself by claiming that the jobber paid him the difference simply on sight of the brand of A's fruit. Then here comes along C with his Washington Navels which cannot be excelled by any grown in California, but they do not bring the price that A's inferior Navels do. The secret here is, that A's inferior Navels ride in on the general reputation of his pack.

We had a chance to see why A now has his reputation established while other growers have not. He began early, before any government specialist came around and told him how to find out the little defects in the systems of handling. He did not pay by the box for picking nor packing. There was never any excuse for a picker or packer to hurry, still a system was used whereby it was known how many boxes were picked and packed by each individual. Every orange is wrapped with the apex in the center of the print and every orange is carefully placed. The pack gives a retailer a full box and when opened is an ornament to any fruit stand. There are plenty of packers that are putting up handsome packages, but Mr. A mentioned above, commenced early and now he is in the lead. It is his reputation that stands him in hand now, but it was his methods that did it.

PRESSING WORK FOR THE PATHOLOGICAL STATION

We recently met a citrus grower who has reason to be impatient over the prolonged delay in getting the pathological station established. What was once one of the most prolific and profitable lemon groves in the state, is fast becoming non-productive. The branches have stopped throwing out new growth and few, if any, fruit buds develop. The leaves drop off and the trees have a wornout appearance. Accompanying these symptoms is a rupture of the bark at some point near the base of the trunk. There is little evidence in some cases of gum, but generally there is no indications whatever of gum. Beneath the ruptured bark is a granulated form of growth that takes the place of the smooth bark.

The lemon grove has received the best of care and has received a liberal amount of stable manure. These liberal treatments have been given to meet the demands of exhaustive crops which have been gathered from the trees year after year. Here is a case that needs the attention of a pathologist at once as the disease but recently appeared.

APPLYING PHOSPHATES

This question is always being brought up and seems to be one which bids fair to be a puzzler for some time. The best time and manner in which to apply it are things not definitely settled yet. The time to apply it is not so important a question as how to apply it. There is no doubt but that it will become available when ever it comes in contact with sufficient humic acid. We get this idea from the fact that the greater part of the available phosphoric acid is found in the humus of soils. This is not a bare theory, but the result of practical observation which is in harmony with the theories on the subject. This works in well with the theory that green-manuring is an ideal mixer for our orange groves. But hold! This is also one of those things that has ceased to be a theory. Can there be any better method of applying phosphates than feeding them to catch crops and giving them the work of sending them down below where the plow or drill can reach? When the phosphates are used by the legumes or other plants or weeds, the fertilizer is carried to all parts of the plants and left right there if the plants are plowed under before they go to seed.

There is no possible way for a human being to apply a phosphate in so finely divided a form to the roots of plants as can be done by plants themselves. This we think is the secret of successfully using phosphates.

Climate and Crops

The weather was unsettled throughout California all of the week. In many ways the weather was phenomenal. A storm. which was plainly marked at the close of the preceding week, did not follow the usual order and move eastward from the State. On the contrary, as late as Saturday night stormy conditions continued. The delay in the storm's movement was doubtless associated with the prevalence of high pressure and typical winter weather over the United States north and east of the Sierra. If the storm had moved rapidly southward and been followed by the high overlying Oregon and Washington, in all probability killing frosts would have occurred throughout California on successive mornings. As it was. the heavy rains and strong southerly winds, and at times strong north winds prevented destructive frosts.

Seasonal rainfalls to date, compared with those of the same date last year, are as follows:

Stations	This season	Last season
Eureka,	27.67	25.10
Red Bluff	20.02	29.33
Sacramento	14.00	17.44
San Francisco	13.15	18.55

The Ornamental Garden

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

ORNAMENTAL ASPARAGUS

The asparagus section of the lily family is one of the best and perhaps the most common. Almost everyone has a "Sprengeri," a "plumosus" or "asparagus fern," or a few vines of 'smilax" (Asparagus medeoloides). Two very beautiful kinds which Prof. Bailey places under the name of A. crispus, are known to horticulture as A. decumbens and A. scandens var. deflexus. The former is a very slender climber and in this climate seems to be deciduous, while the latter is an evergreen and considered by the writer as the most beautiful of the genus. It does not climb, but grows very thick and bushy, making a splendid pot plant. It will stand any treatment that A. Sprengeri will, and is a much finer plant in every way. It does not, however, grow so large or so fast as that species. The latest asparagus introduced to California is A. retrofractus, a very strong grower, reaching to twenty feet in height, perhaps more.

CARE OF SCHOOL GROUNDS.

Every effort should be exerted to do the work well in the beginning. If all preparations are thoroughly considered. and the details carried out with care, the premises should become more attractive year by year with almost no annual outlay of labor. The school grounds should be able to take care of themselves when once the place is set in order.

Of course, better results are to be expected when much labor is put on the grounds each year, but it is useless to advise such expenditure for the rural schools. But it is surprising what excellent results can be secured with almost no attention from year to year.

While the main planting should be made up of common trees and shrubs a rare or strange plant may be introduced now and then from the nurseries, if there is any money with which to buy such things. Plant it at some conspicuous point just in front of the border, where it will show off well, be out of the way and have some relation to the rest of the planting.

RENOVATING LAWNS.

In renovating lawns that have become worn out, and where it is not convenient or desirable to renew by spading up, they may be greatly benefitted by running over with a sharp steel rake. After stirring the surface by such means judiciously, so as not to hurt too severely the roots, lawn grass should be sown over the surface raking in about half the quantity advised for new lawns. After sowing the surface should be raked over, and firmly rolled or beaten down, but if Bermuda grass or other weeds have got posession, then this way of renovation would not be satisfactory, and it had better be turned under and sown afresh. In case Bermuda grass is present in considerable quantity, the old sod should be taken away and piled up where it may be rotted, and from the soil beneath all Bermuda roots should be worked up and picked off. Then, if time will permit, allow the soil to thoroughly dry out before again sowing.

SCHOOL GARDENS.

More than one-third of all public schools will probably always be in the country. They will have most intimate relations with rural life. We must make that life attractive to the pupils.

In Europe there are school gardens, and similar plans are recommended for this country. It is certainly desirable that some area be set aside for the actual cultivation of plants by the children and for the growing of specimens to be used in the school room. However the conditions of Europe are very different from ours. In the rural school in Germany and other countries the school house is the teacher's home. He lives in it, or by it. The summer vacation is short. In this country there is no one to care for the rural school grounds in the long summer vacation. Teachers change frequently. It is impossible to have uniformity and continuity of purpose. In the old World, the rural schools are in the hamlets.

THE LAWN

There is nothing more charming than a well-designed house surrounded by artistically treated grounds; and of the essential features of home grounds none is so important as a beautiful lawn—the rich, velvety turf of the smooth, well-kept lawn, varying in tones of green with the play of sunlight and cloud shadows, being the heart and life of all.

"The Tropics may have their delights, but they have not the turf, and the world without turf is a dreary desert. The Teutonic races all love turf; they emigrate in the line of its growth."—Charles Dudley Warner.

A lawn may be formed either by laying turf or by sowing seed. The gain in time by sodding is mostly in anticipation, an advantage so slight as to be scarcely worthy of consideration, while the results obtained by both methods are not to be compared. Sods, no matter how carefully cut and closely laid, often separate, leaving crevices about which the grass dies out in dry weather; then the grasses that compose a pasture or roadside sod (generally the kind used for "sodding" lawns) are not at all the best for forming a perfect lawn; besides, the smooth, elegant surface, such a desirable feature of a lawn, cannot be secured by sodding.

A perfect and enduring lawn, one of luxuriant richness with closely interwoven, firm, deep and elastic turf, is only created by sowing a composition of the various kinds of grass seeds suited to the conditions and the climate. Several varieties are needed, that the lawn may be verdure-clad during all seasons, and the seeds must be sown liberally (at the rate of from four to six bushels per acre,) not only that a lawn may be produced quickly, but because the kinds of grasses suitable for perfect lawns are fine-leaved and should take entire possession of the ground promptly, thus checking the development of weeds, the seeds of which are in all soils. The coarse pasture and hummock-forming grasses will not produce a fine lawn. Good, rich, deeply worked soil, either of a friable texture or else under-drained, is as necessary for the production of a perfect lawn as for garden crops, although most grasses, being accommodating plants, if they do not get the requisites for the best results, will do their best with what is supplied them. Early and frequent mowing and rolling, as well as the liberal application of water through a lawn sprinkler during the dry seasons, is one of the secrets of maintaining beautiful green turf.—From Peter Henderson & Co.'s "Everything for the Lawn."

HORTICULTURAL SOCIETY

The Southern California Horticultural Society has incorporated under the laws of the State of California and is now a stock company. Two plant and flower exhibits will be given during the current year, one in May and the other in November. The flower show given by this society during the first week of November, 1905, was the most successful, from a financial standpoint, of any ever held on the Pacific Coast.

Now is the time to plant pansies for summer blooms.

In the Vegetable Garden

BY ERNEST BRAUNTON

ENGLISH POTATOES IN AMERICA.

Consul Hamm. of Hull, sends a table giving the quantities of potatoes shipped at that port from November 11, 1905, to January 18, 1906. The total number of bushels was 152,000, worth $64,600, or about 42 cents a bushel. They came from Yorkshire and Lincolnshire. where the land is brought to the highest stage of cultivation and drainage and the best of fertilizers are used. The consul adds that it seems strange that England, with its crowded population, can exports thousands of bushels of potatoes to a country like the United States. with an abundance of cheap arable land. The American duty, too, is 25 cents per bushel.

IMPROVEMENT OF CORN.

During the last few years a great deal of work has been done toward corn improvement. Associations of farmers have been formed in several states for the purpose of improving their strains of corn in yield and quality, and adapting them to the needs of particular localities.

The members of these associations are engaged in corn breeding as a business enterprise, and pledge themselves to sell only corn with a registered pedigree, from breeding plots grown according to the rules of the asociation. These associations have been successful in their undertaking and the members of one of them have scarcely been able to supply the demand for the better seed, although it has been sold at more than double the former price.

Besides being able to increase the yield, vary the width of leaf, the amount of husk, the height of ear, etc., it is possible to change the average composition of corn, and by selection has increased the protein content of a dent variety of corn from an average of 10.9 per cent. to almost 15.0 per cent.

OUR TOMATO DISEASES.

The University of California has just issued a bulletin by Prof Ralph E. Smith, entitled "Tomato Diseases in California," (No. 175.) from which we take the following summary:

"Three serious tomato diseases occur in California: "Damping-off;" Summer Blight," and "Winter Blight."

* * *

Damping-off is a stem rot of the young plants in the seed-bed which occurs mostly in wet, cloudy weather or in seed beds which are over watered or poorly ventilated. It is caused by a fungus or various fungi which spread on the surface of the ground under such conditions and kill the young plants. To prevent this trouble it is necessary to use fresh earth in the seed bed, keep the soil dry on top, ventilate the beds well, and avoid overcrowding the plants. To check the disease when started, spraying the soil and plants with weak Bordeaux mixture. followed by a sprinkling of sulphur, is recommended. A trial of soil sterilization by means of steam is suggested to large growers.

* * *

Summer Blight is a wilt and gradual dying of mature or partly grown plants in the field, which occurs extensively in the San Joaquin Valley and Southern California, and somewhat in the San Francisco Bay region, mostly in the summer crop. The disease is caused by a species of Fusarium, a soil fungus, which causes a dry rot of the roots and cuts off the supply of soil water from the plant. The disease forms one of the present objects of investigation by this department. At present the only recommendations which can be made consist in taking great pains to obtain healthy plants, and planting in new soil. Applications of lime, sulphur, etc., to the soil may be tried by the grower, but the effect of such treatment has not yet been demonstrated. Spraying can not be of any use with this disease.

Winter Blight is a disease caused by the potato-blight fungus, Phytophthora infestans, which under favorable conditions, has seriously affected winter tomatoes in Southern California. The same trouble was observed on potatoes in Sacramento County in the fall of 1904 and spring of 1905, and in the coast region of Monterey County, but it is not very prevalent in California. This fungus causes a spotting of green and ripe tomatoes, dark spots on the stems and branches, and complete and sudden ruin of the crop. It occurs only after heavy rains or very heavy fogs and dews, and consequently affects only the winter crop of tomatoes. Such planting should be sprayed heavily with Bordeaux mixture after every rain to prevent the development of this form of blight.

Directions for Preparing Bordeaux Mixture.

Bluestone, 5 lbs.; quicklime, 5 lbs.; water, 50 gals.

Dissolve the bluestone and slake the the lime in separate barrels. Dilute the bluestone with half or more of the water, then strain in the lime mixed with the remainder of the 50 gallons of water. Use while freshly prepared.

THE POTATO WORM.

The most serious pest in California is the potato worm. The damage to the potato crop in California, as estimated by the writer on a basis of opinions obtained from a large number of growers and dealers, aggregates in some years fully twenty-five per cent.

In one section where some of the finest potatoes are grown, the Salinas Valley, the dealers estimate that at times the loss has gone as high as 40,000 sacks in a single year, and indeed, the potatoes from many sections of the state have to be watched carefully by the dealers to avoid wormy lots. This need of care is because of the fact that a very few wormy potatoes may infect in a few weeks a whole storeroom full of what were originally clear tubers. As the potato is a food product that is expected to retain its value for many months, this possibility of infestation becomes a most serious question.

THE "CHILD OF THE EARTH."

Stenopelmatus, incorrectly called Yellow Ground Cricket, Sand Cricket. Jerusalem Cricket, Common Beetle, and Potato Bug, are frequently noticed in potato fields where the tubers are are bitten into as though mice had been gnawing them. These wounds are quite evident in some specimens and render the tubers attacked unmarketable as a first class product. The insect causing this damage is a large clumsy member of the family to which the katydids belong, and is called in some sections, "Child of the Earth." It has a large and horny head and a soft and heavy abdomen. Its movements are awkward and slow, and its color ranges from yellow to brown. It never has wings. These insects seldom become numerous enough to do any large amount of be yilled wherever found. They can be killed wherever found. They can be trapped by placing bits of board upon the ground in the field. The insects get beneath these boards and may be easily killed there.

JAPANESE HONEYSUCKLE

This Floral Wonder will Transform an Old Shed into a Beautiful Fairy Bower

The Japanese Honeysuckle is a sturdy, rapid climber and within a few months after it is planted will drape your piazza with a brilliant mantle of green, luxuriantly spotted with beautiful white flowers, turning to yellow.

The Honeysuckle grows rapidly—is cleanly—requires no tying. It will twine itself around any support within its clinging reach.

Its presence will add to the value of your property and to your pride in your home.

Its fragrance is matchless. One plant, when in bloom, scents the air with a subtle odor as sweet and lingering as the rarest Oriental perfume.

Matchless Fragrance

The plant is a genuine floral wonder. Its thriftiness, hardiness and prodigal bloom speaks volumes for the skill and plant-loving proclivities of the little brown people of the Occident who have nurtured and improved this climber for so many years. We have imported a large number of these parent vines from Japan. They take root in this country as readily as they do in the native clime. If you are fond of beautiful climbers and appreciate something in plants decidedly bizarre and out of the ordinary, try some Japanese Honeysuckle on your porches and fences. You'll be charmed to see how beautiful this plant will make an ugly old fence or shed appear.

Makes Hideous Places Beautiful

If you have an ugly fence or unsightly outbuilding, plant a Japanese Honeysuckle and within a few weeks you will witness a fairy transformation scene as wonderful as any depicted in Arabian Nights.

We will send you a healthy, thrifty Honeysuckle root for 25c that will bloom all summer and cover a twelve foot arbor.

Ivy Collection—No garden is complete without Ivy. We have a fine stock of healthy roots. The old favorites—Boston Ivy—English Ivy—Kenilworth Ivy—and Variegated Ivy—are 25c per root or the set of four for 50c.

Climber Collection—We will send you this whole collection of seven climber roots postpaid for $1.00. Japanese Honeysuckle—Kenilworth Ivy—English Ivy—Trumpet Creeper—Japanese Hop—Virginia Creeper—Boston Ivy.

Our shipments are all packed with extreme care. All roots are imbedded in moss and the tops protected with wood wool. We have shipped roots packed in the Lilly way from Seattle to New York and they were in perfect condition after their long trip.

Order now. Be the first to have the Japanese Honeysuckle in your neighborhood.

Now the Roads.—This is the time to do the work of the season on the roads. When the rains come several days apart, the surface of the ground is soft and pliable and may be worked to advantage with less effort than any time in the year. When the ground is damp, but not muddy, dirt will work easily and adjust itself to chuck holes more readily than in a month after the last rains have fallen.

The immediate interest of rural districts in the good roads question centers in the practical plans for making the roads as good as possible without the addition of imported material. This applies, especially, to regions where there is no material for surfacing without the expense of shipping in. With no material at hand, it will be necessarily a long time before any, with the exception of the main traveled roads, can be treated. While the building of permanent roads should be carried on as fast as possible, anything that can be done to improve the condition of our other roads will become a great blessing.

The Cultivator has heretofore spoken of a simple device in road-making which ought to be employed in every road district in California, at this time. It is not a road builder, but a road repairer, and its use in so many rural districts in the middle West has proved its efficiency in this direction.

The King road drag for maintaining dirt roads, is proving a blessing to rural districts of the west with the addition of drainage and the use of county graders. Thousands of miles of country roads in the central west will be maintained this year in splendid condition, through the use of the King road drag. The drag is easily and cheaply made at a cost not to exceed $2.00. A beginning could be made by our readers, this spring, by maintaining in first class condition the dirt roads adjoining their farms. Why not take the initiative and start the movement at once?

Why not try the experiment? Do it now, and a little later write the Cultivator the result of your effort. We guarantee a success if the King drag is used.

* * *

Susan B. Anthony.—During the week there has passed from earthly activity one of the strongest characters of the age.

Susan B. Anthony was a distinct representative of remarkable devotion to a cause she loved and believed to be right. Love of freedom was the keynote of her existence. She believed in freedom for all people regardless of sex, color or previous condition of servitude. She was an abolitionist when it required sublime courage to confess the faith. In the strength and vitality of her young womanhood she espoused the cause of the black man. In the days of the anti-slavery movement she was a leading spirit. Undaunted by determined opposition she advocated the freedom of the slave because she believed in it. In company of William Lloyd Garrison she created a riot at Buffalo. Egged and burned in effigy in Syracuse, she journeyed to Jamestown where her reception was no less strenuous and bitter.

During the dark days of the civil war her voice was raised in continuous pleading with the people of the North to support Abraham Lincoln and the Union—without slavery. Henry Ward Beecher pronounced her the Joan of Arc of the cause of American freedom.

But there was another class for whom she demanded emancipation before the bar of public opinion—the emancipation of her own sex. So long as woman was deprived of any right which man was permitted to enjoy in matters of government, so long did Susan B. Anthony regard her sisters as the victims of cruel bondage.

In her notable career Miss Anthony frequently manifested that intolerance which those en rapport with a particular cause are wont to feel toward those who are less enthusiastic or entertain divergent views. This characteristic, however, did not seem to lessen the respect which the public felt for Miss Anthony. She had been for so many years the most commanding figure in an earnest group that men and women everywhere were glad to pay her tribute of their admiration.

Susan B. Anthony passed through many notable periods of our national history—not merely as an unconspicuous observer, but as a participant capable of commanding a hearing. She did not live to see the triumph of the particular reforms which she most earnestly desired but she did live to see recognition of the rights of her sex in wise laws for the protection of heir rights adopted in practically every state in the Union, and their entrance into and splendid success in fields of effort which seemed impossible a half century ago.

* * *

Pardon for Packers.—The appearance of Attorney-General Moody in he Federal Court at Chicago this week strenuously advocating the punishment of the violators of the anti-trust laws, marks an epoch in legal action with few parallels in our national jurisprudence. But the Attorney-General justifies his act on the ground that a great public wrong has been committed, that the people have been robbed, and that individuals who committed the wrong are the ones to suffer punishment, not corporated bodies.

The packers have been among the most flagrant offenders against the law. They have stolen millions from the people and when the Inter State Commission attempted to restrain them . they simply ignored this authority and brazenly declared "what are you going to do about it?"

Now that conviction has over-taken them they are pleading for light sentences. The court should pay no attention to their appeals. The maximum penalty should be imposed, not in a spirit of revenge. of course, but as a salutory warning to all like offenders, that the laws of the land must be enforced Let the strong bear their burden of punishment, for broken laws. in the same ratio as the weak to the end that justice may be meted out to all alike.

It is to be hoped the court may see the virtue of the Attorney-General's contention and affix punishment to individuals, not their corporations, that the country may understand the courts are for good government. and for the impartial administration of its laws, irrespective of the man or men, who would seek to overide them.

* * *

State Board of Trade Report.—The annual report of the State Board of Trade for 1905 has been published. The report contains the information that the fruit industry of the State considered in all its bearings, stands first in importance to the State. Some of the figures taken from the report are as follows:

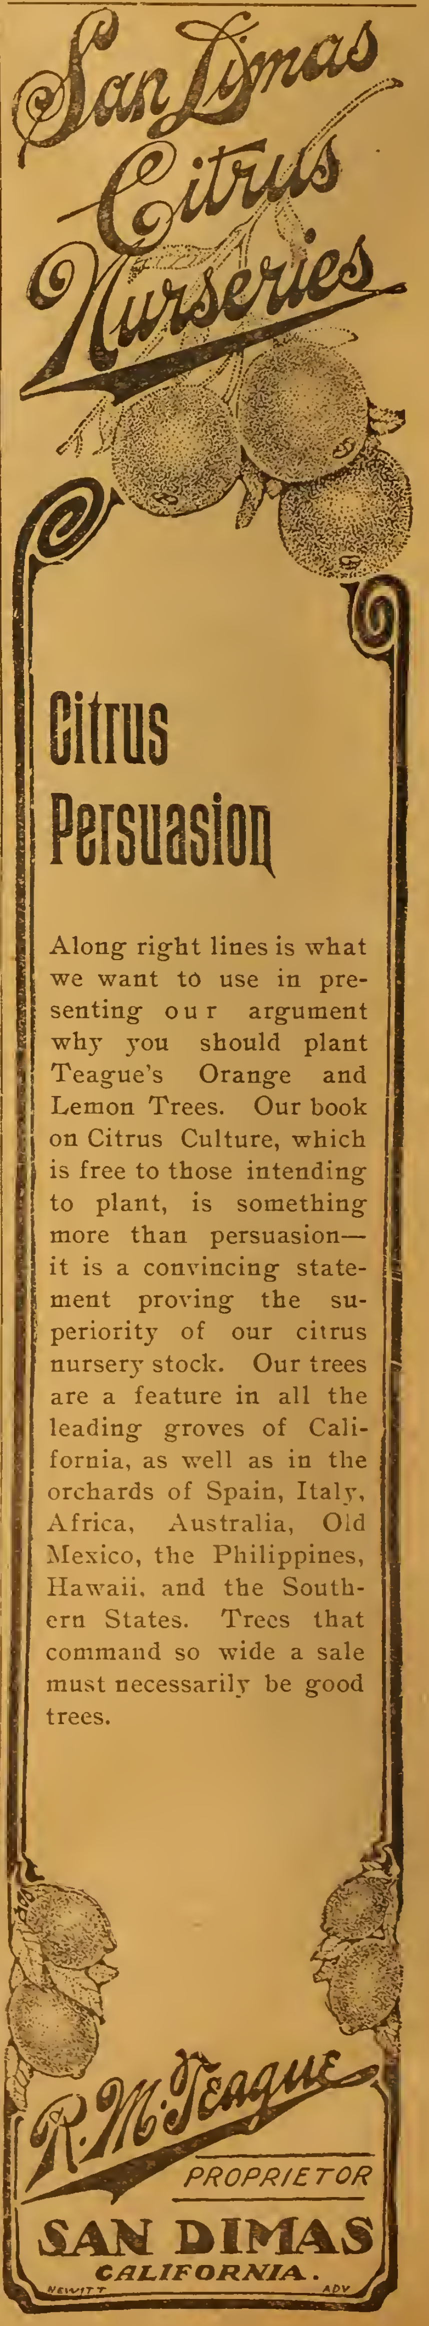
"The fruit shipped out of the State in 1905 amounted to 99,410 carloads of ten tons each. The shipments of fresh fruit in 1905 exceeded the total for any previous year by 1500 carloads. The shipments of citrus fruits amount to 454,083 tons or 45,408 carloads of ten tons each, or 8840 carloads more than all the other fruits and nuts in all forms combined.

"Citrus fruit growing is not spreading in Northern and Central California as rapidly as conditions in that part of the State would warrant. In 1904 the shipments thence were 2216 carloads. Of course where this number is produced a greater number may be. Citrus fruit growing has given Southern California great prestige, and deservedly so, and has added enormously to its material growth and wealth.

"The raisin industry has not perceptibly increased in recent years. The largest crop was in 1904, amounting to 53,134 tons or 5313 carloads. The crop fell off to 3263 carloads in 1905. The center of the industry is in Fresno county. The product of almonds and walnuts has not been increased much since 1899. Shipments of canned fruits since 1890 have more than doubled, reaching 9188 carloads in 1905. The wine and brandy sales throughout the State have been increased from 4765 carloads in 1891 to 10.642 in 1905.

"The table of gain and loss for 1905 compared with 1904 shows a net gain of 7357 carloads. The gains in carloads were as follows: Fresh deciduous fruits, 4110; citrus, 6833; canned, 580; vegetables, 1539; wine and brandy, 493. The losses were as follows: Dried fruits, 3829; raisins, 3150; nuts, 220.

"The butter output of the State increased 6,324,128 pounds in 1905. The revolutionizing influence of irrigation upon dairy industry was illustrated by tables showing the increase by pounds in the butter output of dairies, in irrigated counties, from 1900 to 1905, to be as follows: Fresno from 601.681 to 2,166,048; Kern from 129.848 to 323,363; Kings from 258,750 to 1,444,218; Merced from 623.608 to 1,786,082; Sacramento from 742,443 to 1,578,751; San Joaquin from 506,047 to 1,468,991; Stanislaus from 423,185 to 2,006,171; Yolo from 533,525 to 1,124,907. These eight counties show a growth in five years of 211 per cent., an annual average of 40 per cent. The total value of the dairy output of the State in 1905 was $21,572,902. All the leading industries of the State were considered statistically." The report sharply critizes the counties in California that do not co-operate with the Board. About half the counties show great activity and the other half only passive interest.



San Dimas Citrus Nurseries

Citrus Persuasion

Along right lines is what we want to use in presenting our argument why you should plant Teague's Orange and Lemon Trees. Our book on Citrus Culture, which is free to those intending to plant, is something more than persuasion—it is a convincing statement proving the superiority of our citrus nursery stock. Our trees are a feature in all the leading groves of California, as well as in the orchards of Spain, Italy, Africa, Australia, Old Mexico, the Philippines, Hawaii, and the Southern States. Trees that command so wide a sale must necessarily be good trees.

R. M. Teague
PROPRIETOR
SAN DIMAS
CALIFORNIA.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

Oak Glen apples are selling for $80 per ton.

An 80-acre prune orchard near Santa Clara has been sold for $50,000.

The warm weather has caused buds on the deciduous fruit trees in the southern part of California to swell.

E. J. Oatman of Highgrove claims to have originated a new variety of the orange which is of superior quality.

Ten carloads of oranges were shipped from Orange depot during the week ending last evening.—Orange News.

The Southern Pacific now has over 2,200 fruit refrigerator cars on side tracks in California ready for orange shipments.

The members of the Covina Orange Growers' Association received last week over $35,000 in partial returns for January shipments.

About 100 vineyardists and prospective vineyardists of Ukiah and vicinity have organized the Viticultural Society of Mendocino county.

Harry H. Ford of Redlands will set out 30 acres of orange trees this spring. Half will be Washington navels and the rest Valencias.

The Penn Fruit Company has made a fine orange display at the Riverside Chamber of Commerce, which greatly interests Eastern tourists.

Professor Waite and the Government pear-blight experts have finished their crusade, and there is nothing more to be done until next season.

The fruit companies at Covina have been packing and shipping oranges for the past three months, but only about one-fourth the crop has been shipped.

Orange growers about Sierra Madre are suffering from orange thieves. Their lawless depredations are becoming a great annoyance to all orange growers.

Orange shippers at Redlands are looking forward with interest to a trial of the bushel-basket system of shipping oranges, arrangements for such a test now being under way.—Upland News.

Actual returns from all citrus fruit sold this year have averaged to date $650 a car, against $500 a car for all of last year and $400 a car for the preceding year. These figures are for fruit on the cars in California.—Upland News.

The Hanford Sentinel says: "Although it is somewhat early in the season to talk of the price of raisins. some growers have already contracted their coming crop at good prices, which are understood to be in the neighborhood of $65 per ton.

Professor Waite of the United States Department of Agriculture, who recently came from Washington D. C., to give assistance in fighting the pear blight, is delivering many lectures in the Sacramento valley on the best method of wiping out this pest.

A large dried fruit packing house at Yuba City, Sutter county, commenced last month the filling of an order for Eastern shipment and about 100 women were put to work packing the fruit in fancy packages. The order includes several carloads.—Sacramento Bee.

Last week the Upland Citrus Association paid its members $15,905.38, being the amount for their February pool. This week the West Ontario Association paid its members $5,914.13. for their February oranges, making over $21,000 distributed among the members the past few days.—Record.

A Sacramento telegram says: "Exceedingly large yields of all fruit crops with the exception of apricots. are looked for this season, and the shipments should be equal to those of last year, when 8,000 cars of deciduous fruit were sent east, the greatest season in the history of the State. Apricots will yield only about a quarter of a crop, as the rains were too late in the fall. Those trees under irrigation, however, will produce good crops. Peaches, plums and prunes promise well. The pears this year should be of excellent quality and not disfigured with scabs, as was the case last year. Should future rains not wash the pollen from the cherry blossoms there will also be a satisfactory yield of that fruit. Of the citrus fruit all the navel oranges have been shipped from this part of the state, while Southern California is just beginning to forward its shipments to the Eastern markets.

AGRICULTURE.

Articles of incorporation of the Tulare Beet Growers Company were filed last week.

The Desert Grain Company shipped 10 cars of grain from the local warehouse to Tucson during the past week.

The soil, climate and water of Imperial seem especially fitted to give the very best results in asparagus growing

The cabbage shipping season is on in Orange county; from 5 to 10 carloads a day are shipped from about Fullerton.

As a gigantic industry, sugar beet raising is said to offer unusual advantages in Mexico, on account of the possibility of raising successive crops, regardless of seasons.

The Pacific Coast Steamship's steamer took 500 sacks lima beans, 100 boxes oranges and 1500 pounds miscellaneous freight from port for San Francisco on Friday last.

The Mesa Arizona Cantaloupe Association has agreed to plant 500 acres in cantaloupes this season, from which 150 carloads should be shipped, as last season 52 carloads were shipped from 150 acres.

An industry which is being viewed with concern by the sugar-beet companies in the United States is to be established in Mexico. Three million dollars in gold will be invested in an enormous sugar beet plant.

The express shipments for the week from Escondido were 184 cases eggs, 1,063 pounds of butter, 2,520 pounds of chickens and 1,830 of cream. The volume of cream and eggs was the highest for the Season.—Times.

The California Vegetable Union shipped the first carload of cabbage from district for the season of 1906, Tuesday, from the packing house at Olive. The price of the carload shipped from Olive was $18 per ton.—Fullerton News.

Believing that an over-production of hops is responsible for low prices that have prevailed during the past two years, half a dozen of the most prominent growers are preparing to agitate a reduction of acreage, applicable to all hop growing sections of the State.

The cantaloupe business at Brawley is assuming large proportions. The supplies the present season will include 10,000 crates or enough to fill 275 cars and 4,000,000 paper wrappers. The wrappers will weigh 37,000 pounds or enough for a carload. In addition 100,000 handsome lithographed labels will be purchased, with a new design for the Asociation.

Within the past few months. or since the project was first broached of building an Oxnard sugar plant at Orlando, the population in the immediate vicinity of Orlando has been increased by nearly 2000 men, women and children. Before the first crop is harvested and by the time the plant is ready to operate this number will be increased to 5000 people. So says the Courier.

At Hamilton, an immense sugar factory is building which will be up-to-date in every particular, and with every known device for economical work. The company has bought about 10,000 acres of the finest beet land in the country, here they are installing a most perfect system of irrigation, and have established a high-class agricultural department, with five well recognized agriculturists under the supervision of one agriculturist in chief, whose duty it is to give to all farmers under contract to grow beets free tuition. not only as to beet culture, but in anything relative to the tilling of the soil or the welfare of the farmer.

MISCELLANEOUS.

Tulare is arranging for a May festival.

Visalia has had the worst flood since 1862.

The city council of Modesto has levied a license tax on cats.

Sanger will celebrate May Day, which is the 18th birthday of that city.

On Saturday the rushing waters of the San Jacinto river were heard four miles.

Hollywood is to have a $10,000 public library the gift of Andrew Carnegie.

Pasadena propeses to buy, own and operate a lighting plant for the city and people.

Carnegie has offered to give $10,000 to Oxnard toward the establishing of a public library.

San Diego is to try the gasoline motor car on its street car lines instead of electricity.

Two children in Escondido, aged 6 and 4 years died last week from eating supposed mushrooms.

The town of El Centro is beginning to loom up on the southern horizon as a would-be rival to Imperial.

Oceanside has put down over two and one-half miles of cement sidewalks in the past eighteen months.

Porterville has just organized a live improvement association. looking to street planting and the embellishment of their High School grounds.

A bright and interesting journal has been started by the student body of the California Polytechnic School, San Luis Obispo.

The Southern Pacific road is building in from Orland to Hamilton, and expects to have its trains running into Hamilton within ten days.

There is to be a twelve foot tunnel from Alameda county under San Francisco Bay, to the shores of the peninsula for the great water pipe.

The sixteenth annual convention of the Southern California State Sunday School Association will be held at Los Angeles, April 17 to 19. 1906.

Visalia, the county seat of Tulare, is manifesting a most laudable enthusiasm in the matter of securing her share of homeseekers and investors.

A Corona tailor who last week ran a livery team almost all the way from Corona to Riverside and was arrested on the charge of cruelty to animals was fined $50.

BY MRS. MINNA E. SHERMAN, FRESNO, CAL.

MORE COW

When cows have been bred and fed for the highest milk production, for a few generations, they become so milky that it is not uncommon to have a heifer come into milk several months before she has her first calf. The udder develops and the milk veins fill with blood and a general developing of milk capacity takes place. The heifer suffers severely; when we were confronted with this proposition, at first we hesitated to milk, as it seemed against nature, but after one severe experience it has become our practice to milk whenever there is a secretion of milk that is sufficient to be troublesome to the heifer or cow.

The first case we had was a heifer, and she was not milked, but the feed was reduced to hay and a little grain, watching that the secretions were not checked. The Veterinarian ordered saltpetre and Epsom salts to help eliminations by the bowels and kidneys. After a week the swelling increased until a great mass of soft tissue was hanging from the region of the navel. The Veterinary then lanced it, nearly a five gallon can of serum escaped. The heifer collapsed and nearly died. She was promptly stimulated with whisky, milk and eggs. Nearly a gallon of hot milk was given to supply fluids to the system, and she was wrapped up in a warm blanket in a warm box stall. In twenty-four hours she was on her feet, and calved the next day as the result of the shock. The calf was tiny and without hair. so the then head milker made it a little coat by sewing it up in the leg of a pair of cloth pants, and it wore that little brown coat until its hair grew. A nursing bottle was provided and at night the calf was put to bed in a box of blankets at the foot of the tender's own bed. "Baby" made a good cow herself and I believe is still useful to her owner.

But to return to 501. The heifer struggled along without coming to her full milk flow and was fed all she could digest, mosty silage, as grain she did not care to consume. Sometimes a little bran was acceptable, but as a rule she would not touch it, as she craved cooling foods. At first very thin, the cow gradually gained in condition, yet her butter record for that first year was not kept, as her milk was not used. I feel sure it would have fallen under two hundred pounds, as the milk was scanty and the butter fat very low. But the cow was building herself out of the feed, for even when a cow is in perfect physical condition, it takes from sixty to seventy-five per cent of her food for the maintenance of herself, according to the amount of dairy inheritance she has behind her. A cow in the condition of "501" may be expected to put at least ninety per cent of her food on her back. The milking was, therefore, only kept up to relieve the udder and to prevent a recurrence of the formation of watery serum, for when a thing like that occurs once it is liable to come back again, so that by giving this cow succulent food and supplying the water needed she gained as rapidly as she could without a risk of relapse.

When "501" had her second calf she was ready to work and made 361 pounds of butter and has remained hale and hearty ever since.

The next heifer whose udder was found to require milking out, four months before calving time, was "591." I had her lightly milked once a day, hoping to shrink the milk so she would again go dry, but it failed so she milked right along until she calved at full time, dropping a healthy calf. Then as soon as it was safe she was fed grain right along and made that year 366 pounds of butter. In seven years this cow has never been dry. I know it seems to many people cruel, yet I have never been able to dry off a cow that was giving four gallons of milk a day successfully, and this cow never comes below thirty seven pounds.

I have, during my first experience, with cows forcibly dried them off by starving and by using camphor on the udder, always to have trouble with inflammation of the udder and often with the loss of a portion of it. I stopped it then, and have not had three teated cows since in any numbers. I am not at all prepared to say that if I was personally milking the cows I could not dry them off myself, but I know from bitter experience that I have caused financial loss and worse, great suffering to the helpless cows by ignorant persistence in trying to dry off a secretion that had been cultivated by breeding and feeding for generations. Nature has always more than one law; we often forget that; saying that Nature dries off a cow and therefore she intends we should follow her example, and so Nature did, before we tampered with her, and educated the cow to great production, then failed to recognize that Nature has a second law that secretions and eliminations must be removed, or we have the body self-poisoned, or as the physicians say, auto-infected. It is this that causes the terrible convulsions of Bright's disease in the human family. To return to the cow "591." She was liberally fed and never thin at any time and has always seemed to be absolutely well.

Another heifer that came fresh in the same way, three months before calving was "633." It was determined to dry her off at all hazards. She was milked leaving always a little behind, taken from the pasture and fed hay, the udder rubbed with camphor. Five weeks before calving she was completely dry, but thinner than a cow should be to freshen satisfactorily. She came in with a scanty supply of milk and never gave over a gallon at a milking. I kept her and fed her well, but it was useless. With the second calf she gave only four gallons a day, making less than seven pounds of butter a week so she was made into beef. Now this last was a full blood out of a dam having an official record of over eighteen pounds of butter a week and has also three advanced registry sisters—expensive beef.

Since that time I have had nearly every year, two or three springing heifers to milk. Sometimes these go dry naturally, if they do all right. They are fed a simple grain ration without oil cake meal and allowed half ration of silage. They are not forced, nor are they starved, but Nature is simply helped to do her best by them. The Holstein and Durham have both given these springing heifers and I have not in my limited experience with Jerseys had them do so. I presume that any breed which gives quality milk, rather than quantity, would be less liable to have these troubles. I realize that it is dangerous to mention breeds and will not do so, as some are so rabid about the matter. I am often amused at this strife for, after all, there are wonderful cows in every breed and it is more a matter of the man who handles them than the breed. Take the Brown Swiss in California, they have not been fortunate so far in their owners who have failed to show them up as they should and will not be able to do so until the price comes down to a reasonable basis. When they have the chance of falling into the hands of practical dairymen with the vigor they possess, they should show up well in the front rank as economical producers of butter fat.

A HORSE PARASITE.

The Kansas State veterinarian reports outbreaks of a trouble in horses in different parts of the state, caused by the palisade worm (Stronglyus armatus.) Each outbreak caused a loss to the owner of nearly a thousand dollars. From the fact that the trouble does not always manifest itself in the same way, it frequently puzzles the local veterinarians for some time. This worm may be found in any part of the body. Its natural habitat, however, when full grown is in the intestinal canal, usually the large bowel. In its immature state it migrates into the blood vessels, sometimes causing rupture of a large vessel or obstructon of the flow of blood and in this way has lodged in the arteries of the brain, causing the animal to show brain trouble. Again it has obstructed an artery leading to a portion of the intestine, causing some of the most serious cases of colic, impaction. paralysis of the bowel, and frequently death. Being located in different organs, the symptoms are different in different horses. The life-history of this little worm is interesting. It passes the greater portion of its life in the in-

RING BONE.

Editor Cultivator.—Could you give me a good receipt for curing the ring bone on a horse. Valuable animal. I would be very thankful to you. C. N. R., Winters, Cal.

The ring bone is a deposit of new bone around the short bones between the hoof and the fetlock. It starts as an inflammation of the periosteum (skin around a bone), and the continued inflammation results in the formation of the new bone between the old bone and the periosteum. In bad cases the inflammation extends into the bone and often into the joint, in which case the growth of new bone is so close to or in the joint proper that it is impossible to cure the lameness except by cutting the nerves running to the foot so as to remove all sensation. Ring bones are caused by sprains, injuries, etc., and often by working colts too hard before their bones have matured. Heredity also plays a large part in this kind of disease. While no colts are born with ring bones, colts from mares or sires that are affected with ring bones or that have weak, poorly formed pasterns, are very apt to be foaled with weak bones in these parts, that will become affected under conditions that would not affect a colt with good strong pastern bones. The growth of a ring bone can usually be killed by heavy blistering, or still better, by firing. But where the growth is large or the joint is affected this will not remove the lameness. If the growth has been checked by the firing or blistering and the animal still goes lame, the only thing that will stop the lameness is to cut the nerves leading to the foot. This is a delicate operation and needs a qualified veterinarian to perform it. A good blister for a ring bone is made by mixing 6 drams of red iodide of mercury in 2 ounces of cantharides cerate; clip the hair and wash the parts thoroughly with soap and water; then rub the blister in well. Leave on until the parts are well blistered; then wash off and oil with fresh lard. After the effects of the first blister have recovered, apply again. Tie the animal so it can not bite the parts and allow it to rest in the barn six or eight weeks. There is no use trying to kill ring bone while the animal is at work or running in the pasture.

THE COW AT CALVING TIME.

When the cows are kept on dry feed a feverish condition is often present, and this is highly unfavorable to a satisfactory outcome at calving time. Inflamed udders and milk fever result from this condition. The excrement is always a token of the physical condition of an animal, and in order to be best prepared for a successful parturition the bowels should be in a lax condition. Oil meal or bran always has the desired effect and no one who has pregnant animals should be without these food by-products for use before and after-delivery.

* * *

If milk fever is threatened or if there is an unusual preparation for milk production, it is wise to give the cow small doses of salts—epsom or glauber—say an ounce daily. This method is preferable to giving a pound dose at one time, as often recommended. If the udder is unduly inflamed, we can safely suggest the use of aconite tincture in twenty drop doses two or three time a day. Bathing the udder with ammonia is also useful in cases of inflamed udder. But we have seldom failed with the aconite if administered when first symptoms of inflammation appears. It is given as a drench or a bran-mash; which is fever allaying of itself.

* * *

A hearty condition of the cow at calving time is the best assurance that she will "do well" afterward. A failure to expel the after-birth is due to weakness, either from prolonged labor or lack of vitality to withstand the strain upon her system. The after-birth must be removed by force if necessary or bad results will follow. If there is reason to suspect that everything is not progressing satisfactorily, give the cow a pailful of dry oats. Do this at once after calving and the outcome will prove the efficacy of this remedy. Under intelligent, liberal feeding, this trouble rarely comes, but where cows are allowed to become thin there is much complaint that cows are not doing well. Good care, like charity, will cover a multitude of sins—of omission.—Farm Stock and Home.

DISPOSITIONS OF COWS

Cows differ as much in their dispositions as human beings. Any farmer that has handled a large number of cows will have run across the stubborn cow, the affectionate cow, the motherly cow, even the bossy cow. Some of these qualities are good and some are bad. A man should try to eliminate the bad qualities and encourage the development of the good ones in the selection of the cows for the continuation of his herd.

SHETLAND PONY LONGEVITY

A remarkable record in longevity and reproductiveness of a Shetland mare comes from the famous Woodburn farm in Kentucky, known the world over in times past as a nursery of thoroughbred and trotting horses. The Shetland pony Belle foaled last year a black colt when she was 30 years old. It was small but managed to live nearly a month.

Save the manure on the farm. When properly applied it means more crops and better crops in years to come.

The cow is the best friend the poor man has. She furnishes both meat and drink.

The curry comb and brush are the horse's bath.

Sharples
TUBULAR
CREAM SEPARATORS

21 POUNDS MORE BUTTER PER WEEK

Barnesville, Ohio, June 20, 1905: We were milking ten cows May 19. That day we took a Tubular separator for trial. **We used it one week and got 86 pounds of butter that week. The week before** we used it, we got only 65 pounds. **The week after** the agent took it away we got only 64 pounds. We felt we ought to have it. Later we arranged to buy it. We recommend the Tubular to anyone interested in cows. It surely will pay any one to buy a Tubular.

Profit in the Poultry Yard

BY MRS. A. BASLEY, [illegible]

THOROUGHBRED VS MONGREL

I have a letter, just received, from one of our readers, saying, amongst other kind words, "your article on breeding was just what I have been looking for, and if it be not asking too wuch of you, would like the benefit of your experience." The questions that follow are many and will be best answered by my quoting from an article which I read some years ago from Farm, Garden and Poultry.

In discussing the assertion by Mr. M. K. Boyer, that if a pure breed of hens be allowed to associate, in ever so short a time with a mongrel cock, the ability of such hens to breed pure blooded stock is forever destroyed. However pure the blood or subsequent cocks may be, that associate with those hens, their progeny will be mongrel. If this is a fact, there must be a law of nature producing it, that should be understood and the mystery explained. That it is a fact, observation by careful breeders of pure stock proves.

* * *

Mystery is but another word for ignorance. As man learns nature's laws, mysteries are solved and disappear from the mind. There are no phenomenons but have a cause. The principle underlying the above stated phenomenon is a very important one and should be understood by all breeders of pure stock of any kind.

The law involved is not confined to fowls, but is universal with all life. The young mare whose first foal is a mule, will always thereafter mark her foals, although subsequently bred to the most perfect stallions, with characteristics of the ass. If bred to a quagga, she will always mark her progeny, though bred afterwards to a stallion, after the quagga. The stripes of the quagga will appear on all her progeny. This law of the animal world pertains the same to the human species. The woman who gives birth to a colored child will always mark her subsequent children, though by a white father, by the former colored parent. To illustrate this law under consideration. All understand that the blood of the mother circulates through the child while in embryo, and from the child through the mother. The blood thus is charged magnetically, by the action of the life forces of the embdyo, and becomes like the embryo in a degree. This subtle fluid dominates and impresses it's forces upon the whole physical nature of the mother. This magnetic fluid is composed of the ethers of the impregnating principle, which are the central life forces, transmitted to the embryo by the father. The blood and the magnetic forces of the mother become affinitized to these and become a part of her physical being, and, therefore are as lasting as her physical life. They may be modified in after life but never fully eradicated.

* * *

The deepseated ethics imparted by the male, dominate in giving character to the progeny, and through the progeny—embryo—changes the nature of the female to a degree hardly dreamed of by the common mind. Many observers have noticed the change of features, expression and even character of the wife to that of the husband when harmoniously mated, and their magnetic natures agree. The wife in such cases grows into the likeness of her husband. He is the positive element dominating physically, while she is the negative and receptive element and therefore takes of his nature more than he does of hers.

The breeder of cattle has learned that the male soon changes the whole herd into his likeness, but this is usually wholly attributed to his influence on the progeny, and no account has been taken of the change produced in the mothers from the principle illustrated above, which is an important cause of the rapid change of the herd. The long-horned, lanky Texas cattle have nearly disappeared from the great plains of the Southwest, because of the selection of short-horned males for the long-horned herds, and it has taken but a fe wgenerations to change the form and character of these longhorned cattle into apparently nearly pure blooded short horns. A part of this rapid change in these herds may well be attributed to the change in the nature of the mothers, by their association with these blooded males.

* * *

No apply this law to the hen. The same law pertains to all. There is a preponderating influence of the male on the progeny as great as in any other animal. By associating a pure blooded hen with the scrub cock, she, by this law, takes of his magnetic nature, and this lower magnetism becomes a part of her life force, and thus changes her nature and renders her incapable of imparting her former nature to her progeny.

It may be thought that the example of the circulation of the blood through the embryo and mother of placental animals would not apply to the egg-laying animals. Remember, it is not the blood, but the magnetic elements that pervade and it might be added, impel the circulation of the blood, the mangetic influence is the force causing the phenomena under discussion. This force is primary, lying at the very center of physical organization and activity in the non-animal as well as in the animal world.

A good example of this is the arc light. Two carbons (one conducting the positive and the other the negative magnetic electric currents) are brought sufficiently near each other to permit of the passing of these currents from one to the other through the intervening air. The air resists their passage and becomes heated by the rapidly moving currents of electricity to incandescence. The carbons melt and throw off particles that become incandescent, and pass over this airspace, the positive carbon to the negative, and the negative current those from the negative carbon to the positive one: but the positive current carries far more carbon to the negative one than the negative one to the positive, and therefore the positive carbon is much quicker consumed. The positive is the stronger, while the negative is the more receptive force. This is fundamental in nature everywhere. In life these forces are embodied in the sexes, the male is the positive and the female the negative forces. It is one law in all foration, animate and inanimate and is fundamental in all activities. The two must always act together to produce any effect or activity. The positive is always the stronger.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER

Used by all the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hap-hazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the GOLD MEDAL at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A FILCHER, Commissioner.

And Now Comes New Reward for Merit:

Read the following telegram received from the Lewis & Clark Exposition at Portland:

"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

A COW OR HENS—WHICH?

Secretary Wilson, in the United Stats Agricultural Reports for 1904, gives the value of poultry and eggs as $280,000,000, placing this industry at the head of the list. These figures astonished the country and led to an awakened interest in the poultry industry, evn in California.

In the Country Gentleman, of recent date, a writer makes the statement that "poultry returns a larger per cent. of profit for the capital invested than any other farm crop."

To prove this declaration he takes the sum of $50 as an investment. to start the business, investing first in a cow, then in poultry, and gives the result in the tables which follow:

A good fresh cow with her second calf will cost all of $50 and be cheap at that. She will average 8 quarts per day the year round, or 2920 quarts for the 365 days. The average price the farmer gets for his milk is 4 cents per quart, which will be $116.80 per year. In order to secure this amount, he must house and feed his cow well. For six months of the year his feed bill will be about as follows per day:

2 lb. bran, at $0.012 per lb	$0.024
4 lb. ground oats, at $0.007	.028
4 lb. Chicago gluten, at $0.015.	.060
30 lb. hay, at $0.006	.180
Total	$0.292

This daily average comes to $8.70 per month, and $52.20 for six months. The other six months he will feed about 2 lb. gluten per day at $.015 per lb., which will amount to [illegible] for the six months, bringing the feed bill up to $56.70. His stable room will be about $12 dollars a year, making a total expense of $69.60, leaving a net profit of $47.70. He should add $5 for the calf, making $52.20. Now for the poultry. Here is our initial outlay:

Henhouse, 6 by 6 feet, painted	$20.00
10 hens (thoroughbreds) at $1	10.00
1 cock	2.50
1 roll 6-foot wire, 150 feet	4.00
15 posts, at 15c	2.25
5 lb. staples at 5c	.25
1 year's feed, at $1 per head	11.00
Total	$50.00

Everything is paid for, and we can figure the profits. A hen will lay, if properly housed and fed, 110 eggs per year. Out of this number, we must save 200 for setting, so we shall have ten times 90 eggs for sale, the average price of which will be 1 2-3 cents, or $1.50 per hen, and $15 for the ten. Now we shall set the 200 eggs, which will give us 130 chicks. Of these, we can raise 100; of this number, 50 will probably be cockerels. Five of these we shall save for ourselves; 45 we shall sell for 50 cents, or $22.50 for the lot. This money will pay for raising the pullets until they are ready to lay, which will be in six or seven months.

By November the pullets will be laying and should give about 20 eggs per day, 600 per month, and at that time of the year the price will be 3 cents apiece, $18 per month. The account on Jan. 1 will read about as follows:

Eggs from hens one year	$15.00
Eggs from pullets three months	36.00
50 pullets, valued at 50c	25.00
5 cockerels. at 50c	2.50
1 henhouse	15.00
Total	$93.50
Feed for 50 pullets for October, November and December, at $1 per year	12.48
Remainder	$81.02

Let us make our comparison. The cow brought in $47.20 and we do not own her stable. The poultry brought $81.02. We own their house and have 50 additional pullets and five cockerels for the new year. These estimates are all low, and can be proved. The prices for grain and eggs are eastern prices. But even so, if we in any way neglect either the poultry or the cow, the profits will soon vanish; for, after all, success depends on the man behind the gun.

The beautiful circular from Capitol Avenue Poultry Farm, giving pictures of their prize winners is on our desk. This circular should be in the hands of every lover of fine poultry whether they raise white Wyandottes or not. It is free.

200 Eggs a YEAR From One Hen

CAN YOU show this record?

How many possible eggs have you lost—eggs which you might have had—if you had been using a feed which had been tested for you.

A Feed which makes a 200 egg Hen out of a Scrub, and makes a 200 egg Hen lay 225 to 250 eggs a year. Figure it out.

How can you afford to make expensive personal tests, when

PURINA POULTRY FEEDS

will bring out every egg your hens are capable of laying. A feed which will bring EGGS in Winter as well as in Summer—40c Eggs as well as 12c Eggs—from ALL your hens.

And you don't have to take our word for it, either—just try PURINA FEED at our expense, and believe the evidence of your own senses—that's all. It won't cost you a red cent to prove us right or wrong.

If the results don't come, just tie up the bag and write us, and we will return every penny of your money and tell you what to do with the unused feed. You are not out a cent in making the trial, for we will supply you through your dealer or direct FREIGHT PREPAID and the feed used in testing costs you nothing.

This is the Money Back Line—
Write today for particulars about our FREE TEST Plan.

Cat. free. PRACTICAL INC. CO., 720 S. 11th St. San Jose, Cal.

Why do you pay $5.00 to $8.00 per hundred for eggs for hatching when you can get just as good eggs from just as good stock from us at one half that price? Our stock is large and healthy. The hens lay lots of large white eggs that run as high as 98% fertility. We sell eggs in incubator lots only at $2.50 per hundred.

Avenue Poultry Yards, Ventura, Cal.

COSTLY POULTRY.

Editor Cultivator: I wonder how many readers of your fine journal have been deluded into purchasing costly poultry? I was, and I want to say, that while my husband and I thorourghly appreciate the charm, as well as the value of the pure bred poultry, and have invested in them many hundreds of dollars we are free to confess that many dollars would have been saved had we gained our experience with less costly birds. When we started in the poultry business we knew just what most farmers do of poultry; that is, we had kept from fifty to a hundred mongrel hens year after year, we say we kept them, but in reality they kept themselves. We fed them, or rather all of the home fed them, and when eggs or carcasses were wanted they were easy to find. We believe we made considerable pin money from the hens and we remember that many comforts were found in the home which the farm proper did not supply. But when the "hen fever" struck us nothing but pure breds would do and $50 of hard earned money went into such stock. We will not say what resulted. Enough that it was not profitable and the third year we were content to go less fast and gain experience from a dozen pullets, the result of hatches from two sittings of $1.50 a sitting eggs. From experience we can advise others to start in this way. Get experience and then will be time enough to experiment with the purebred breeds.—Ella G. S.

BE GOOD TO THE HEN.

What the hen on the farm needs is the proper assortment of grain, plenty of green food and a full proportion of meal and grit. If this is provided and they are properly housed and made to exercise you will have hens in winter when it pays well to have them.

If the cow is not by nature a heavy and rich milker, all the balanced rations one can prepare will not make her such. So with the hen. She will only return for food and attention up to her original capacity.

More and better green food supply and more meat of some kind are what the hen needs for winter egg production.

As to what is enough green food we would say all they will eat. As to the quantity of cut bone or meat, all you can afford to give them and hold a profit, as a possible egg yield of say three eggs per week per hen.

Give them of animal food less than one-tenth of their whole ration of meat, and from this up to one-fifth of their whole ration of meat as cost will permit.

In securing a good supply of eggs the inborn tendency of heavy laying is an important point. It is a tendency which goes in certain strains the same as in certain families of cattle, and without it no amount of skillful care and feeding will produce the best results.

Chickens that are poor without being cared for make but small progress in life, seldom, if ever, become the best egg producers. To have the best results with a quick spring growth necessary for the establishment of size and vigor, they must be well fed, regularly fed and properly fed from shell to finish. Anything short of this insures an advance to poor growth and poor results all along the line.

Pick all small, slow-going indifferent appearing pullets and save them for broilers. Keep for maturity only the best of the whole lot of pullets.

THE SURPLUS STOCK.

One of the best poultry breeders of which we have any knowledge has a house especially constructed for his surplus stock. He is a breeder of pure bred fowls and sells many thousands each year. He has a number of houses for his breeding stock and such are kept in breeding condition all the time by a system of management peculiar to their wants and requirements.

The stock that is to be sold is selected early and placed in the house set apart for that kind of stock and all are fitted to best come up to the purposes for which they are intended. This house has several apartments. One apartment is devoted to that stock which does not come up to the requirements as to breed qualifications, which may be disqualified for breeders.

LAYING HENS

We have a few choice 1½-year-old Thoroughbred White Leghorn hens, which we are offering at a sacrifice. In order to make room for our young stock we are offering these fowls at $15.00 for 12 hens and 1 rooster or $100 per 100.

We also have a number of 5-months-old pullets, also of the same variety, on which we can name you the same price. If your stock needs renewing, send in your order at once, as they are going fast.

We have a Hatchery of 50,000 chicks per month capacity, from which we are making shipments daily to all parts of the Coast. If you need any just hatched chicks have your order booked at once, so as to get them on the date desired. Our price for just hatched chicks is $7.50 per hundred f. o. b. Petaluma.

We manufacture the famous MUST HATCH INCUBATORS AND BROODERS and a complete line of poultry supplies of every description. We cater to the best hatching egg trade on the Coast.

Before purchasing write for our new illustrated Catalogue B. which contains descriptions, prices, etc., of all our goods.

Must Hatch Incubator Co., Petaluma, Cal.

These cannot be bought at any price by customers or those who would use them as breeders. They are fitted for another market and are marketed in such a manner that they can cast no reflection on the honesty or ability of the breeder. He hires a man to dress them when they are ready for the market and he is quite sure that none of them will ever be used to his own disadvantage.

Another apartment is devoted to males and still another to females for sale as breeders. These he has graded as to merit and price. When a customer comes he can see anything from the dollar cockerel to the ten dollar bird. As we looked through the house we wished that more breeders could see his system of management and there would be less reason for classing the poultry breeder among those of doubtful honesty. He says he cannot afford to sell a poor bird of any kind. It advertises him in the wrong manner.

We are of the opinion that the grower of poultry for the market can afford to have a house for the surplus stock and for that which is being fitted for the market. In the fall of the year he can select those to be used as breeders, those for layers and then he can use the surplus house for fitting all others for the market, which should require but a short time. When they are sold the house can be converted into laying quarters or given over to some other flock kept for another purpose.

When the average poultry breeder will make a selection of his breeding stock in the fall of the year and everything selected with a view to improvement, then there will be less complaint of the non-paying fowl. Selection and intelligence can be observed in a flock quite readily. Neglect is also as readily visible.

SHELLESS EGGS.

Shelless eggs are due to various causes, sometimes a lack of lime in the feed. In this case it is without a doubt due to some other cause. It is seldom that we come across as good a system of feeding as is detailed in this letter. As a result, the pullets having been well bred, respond with a high percentage of eggs. In the writer's opinion the cause of the shelless eggs, as well as the double yolk one, is due to an overly stimulated condition of the egg organs causing inflammation of the same. Such condition will usually yield promptly to the following treatment. Give the fowl one tablet of ustilago madis 2x, three times a day, until she recovers.

THE DELUSIVE HEN

More men have sailed to shipwreck in the poultry business than in any other that one can easily recall, and yet there is no other business which, from every consideration of mathematics, political economy and biology ought to pay so well.—Portland Oregonian.

A hen can't dig and scratch lice all night and keep healthy and a broody hen cannot remain quiet with hundreds of parasites making football rushes over her anatomy at all hours.

Lice breathe through their pores so any dust will stop their breath and we owe it to Biddie to make her as comfortable as possible.

Oh. yes, poultry raising is pleasant and profitable for women, but "Don't start into poultry if you are afraid of soiling your hands."

Even now if you find any overfat hens in the flock, dispose of them at once.

Keeping hens busy is of first importance but should not be carried to extremes.

Because a hen will eat filthy food is no reason why more of it should be fed to them.

A steady diet of raw oats sometimes causes indigestion. It is better to scald or cook the oats.

Overcrowding, overfeeding and under-exercise are the common causes of failure with poultrymen.

It may be that your young stock is the best, but as a rule the strongest chicks are produced from old and well matured birds.

White Wyandotte Eggs

For hatching. Pure Dustin & Hallack strain. From 1st Pen, $3.50 per setting, 2nd pen, $2.50.

STREET TREES

Continued from first page.)

evergreens, our most beautiful tree perfectly adapted to local conditions. This tree is supposedly of slow growth but in good soil and with sufficient water for the first few years it will keep pace with the average tree. The oaks should not be planted too close together, 40 feet being near enough for country roads, and in case of 50 foot lots, one every 50 feet at the dividing line between the lots, with some smaller growing tree between. The latter could in after years be cut down. A better plan would be to plant between the oaks two fine flowering shrubs, even though they were deciduous, as the crepe myrtle. These could later be moved to the yard, or find a ready sale for large estates, being always in demand. The crepe myrtle is extremely easy to move when of a considerable age.

Many trees claim second place, but the Victorian Bottle tree (Sterculia diversofolia,) has proven satisfactory in nearly all parts of the State. It is one of the cleanest of trees, of a bright. pleasing shade of green, the trunk is straight and mast-like, the branches are not far reaching and therefore not liable to injury by wind, and need little, if any, pruning; it is a fast grower when well supplied with water, yet noted for its drought resisting qualities. Its general outline is well nigh perfect, its carriage peaceful, it does not grow so thick as to harbor dead leaves and rubbish, yet enough to cast all needed shade. Seldom does one make abnormal growth and it will not injure the sidewalk by upheaval.

Trees of equal value may be found in the acacia family, in dealbata, decurrens, mollissima, saligna, cyanophylla, or any of the medium or large growing species. The most common one is the Blackwood (A. melanoxylon,) but it is not adapted to semi-arid or mesa conditions. It needs a rich, deep, moist soil.

St. John's Bread, or Carob Tree, is one that is bound to be extensively used in the future. It is a very fast grower and its drought resisting qualities are of the first order. It has been tried under varying conditions and always found satisfactory.

The common Grevillea robusta is a fair tree for dry localities in the country but for use in cities or towns it is too dirty. It should be pruned at least every other year for six or eight years. for the wood is quite brittle, and easily broken by the wind.

There are three species of Pittosporum which would make fine street trees, but they are as yet little known, though in time I believe P. undulatum will head the list. (Ligustrum lucidum,) a privet is very showy and soon attains the dignity of a tree. Several eucalypts are worthy of a place along the roadsides, but for more thickly settled sections I do not like them. The best species are: rudis polyanthemos and ficifolia.

Some streets should be planted to palms, to gain variety, and for this purpose the Mexican Fan palm (Washington robusta) is by far the most suitable, while the Chinese Windmill palm (Trachycarpus excelsus) is the best for narrow streets. The latter palm is known to nurserymen in general as the Chamaerops. Washington robusta grows, in height. about four times as fast as Washington fiilifera, the California Fan palm. Palms, however, should always be accompanied with other trees and shrubs, and be given liberal parkways.

A few streets should be planted with flowering trees, such as Jacaranda, Lagunaria, and the crepe myrtles. The first named needs pruning for the first few years but the magnificent crop of blossoms would amply repay for such care and it has given satisfaction where ever tried. It is not as essential to have some particular tree as it is that each street, or each block at least, should be planted with but one sort. and in carrying out this plan, cooperation is the keynote to success.

Plant roots are now packed so carefully that any one can order them by mail with confidence that they will arrive in good condition.

The C. H. Lilly Company, of Seattle, who have had singular success in shipping roots, have a wet and dry process which is peculiarly their own. All tops are packed in dry wool, which affords a complete protection from damage by mail, and the roots are imbedded in moist moss. As a rule roots from the Lilly Company can be grown successfully by simply dropping them in a hole and running a little water in while the hole is being filled with dirt. The water sluices the dirt in among the roots and gives the tiny feelers a nice bed.

When roots look dry it is best to immerse them over night in water. Roots which look absolutely dry can frequently be saved in this way.

The Bolton Electric Alarm has saved many an orchard and vineyard in California. It is an automatic thermometer alarm which may be regulated to ring a bell at the bedside of the watcher a mile or more, if wished, away from the crop which is in danger, thus arousing the owner to build the fires, which have been found sufficent to raise the temperature above its danger point. Mr. Bolton is located at Fresno and will give further information on request.

The Way to Get Ready for Harvest

It is not enough to *grow* a good crop.

You have to *harvest* it, before you get your profits.

And your profits now depend very largely upon the *way* you harvest it.

A worn-out harvesting machine, or one that is not very good, even when new, may delay you long enough and waste enough grain, to turn your profits into loss.

It is a mighty poor policy to grow a good crop of grain and then let a part of it rot in the field.

It does not take a great deal of *waste* to eat up all your profits.

It may be only a spoonful of grain at a time but it counts.

Don't waste.

You can't afford it, and there is no necessity for it.

Get ready for a *profitable harvest.*

Do it now, while you have time.

Here is the way:

Go to an International Harvester Company of America dealer and ask him for a catalogue of the machine he handles.

He will be pleased to give you the book—and you will be pleased to get it.

He will be pleased to show you the machine—and you will be pleased to see it.

You will find the book extremely handsome, well illustrated with good pictures, interesting from start to finish and full of good, common sense about harvesting machines.

But more important, you will find a *good* harvesting machine.

That is what you are most interested in for that means dollars and cents to you.

We take it that you want a harvesting machine

—that you can depend upon to see you through the harvest without break or delay;

—that will save you the greatest amount of time and labor and worry and trouble in the busy harvest days;

—that will harvest the grain you have grown with the least possible waste;

—that will not go to pieces after cutting a few hundred acres;

—that will be easy on your team;

—that you can get repairs for easily and quickly when you need them;

—that will, in short, give you thorough satisfaction in every way—doing for you everything that you can in reason expect a harvesting machine to do.

If that's what you want, all the more reason for looking up the agents of the International line.

You know the line—the six leading makes of harvesting and haying machines, used wherever grain and grass are grown:

Champion, Deering, McCormick,
Milwaukee, Osborne, Plano.

Better harvesting and haying machines cannot be made.

As good harvesting and haying machines cannot be made *without* such facilities as the International Harvester Company possesses.

Such facilities are made possible *only* through the co-operation of the manufacturers of these several lines of machines.

It is co-operation which enables them to produce from forest and mine their own raw materials—and thus be independent of uncertain and fluctuating markets. Acting together, they own, control and operate their own coal and iron mines, their own coke-ovens and steel mills, their own lumber camps and saw mills. They not only get their raw materials of first quality, but what is of equal importance they get them when they want them.

It is co-operation which enables them to maintain experimental shops where every effort is made to perfect the principle and improve the design of the International Line.

It is the great *demand* for their machines which enables them to equip their factories with every possible facility for producing machines of the highest excellence—factories and workmen which could not by any possibility be maintained to supply a small demand.

It is this *demand* which enables them to maintain agencies almost everywhere where grain is grown—convenient to you—convenient to buy—convenient to secure repair parts.

The fact that so many farmers cannot be persuaded to buy any other,—the fact that so many farmers continue to buy them,—the fact that they are considered the standard wherever grain is grown in every part of the world is sufficient indication of their reputation and their reliability.

We don't believe that you will be willing to let harvest time approach without knowing more about the International line for 1906; we *know* you will be glad to get the catalogue. Call on the dealer at your very first opportunity.

Go to the dealer *now*, and get whichever catalogue you want.

If you don't know an International Dealer—write to us for the name and address of the one nearest you.

Queries and Replies

BURR CLOVER

Editor Cultivator—Can you tell us if the enclosed plant is dodder? We found it in alfalfa. C. Bros., Imperial.

The plant is Burr-clover (Medicago denticulata) the closest relative of al falfa, (which is Medicago sativa.)

CALIFORNIA POPPIES.

Editor Cultivator: Is it now too late to sow California poppy seed and have seeds ripen again this season? —L. C. S., Lemon Grove.

No. Balance of your questions answered in our first page article.

NO RULE CAN BE GIVEN.

Editor Cultivator: Will you inform me of your idea of feeding hogs. Have raised lots of hogs, but have always done it one way. I wish to get some one else's idea. Suppose I should start in with a sow and a half dozen pigs. How would you care for and feed until time to fatten for market? Would swill from hotels hurt them as it sometimes does chickens? What is the most profitable hog to raise? Do you know of any one around here from whom I could purchase a start. I have been a reader of your valuable paper for a number of years, but have never thought seriously about the best way to raise hogs to pay much attention to what has been written in regard to them. —C. G. D., La Canyada.

The editor of this paper has raised hogs in Iowa for fifteen years, but when it comes to telling anyone else how to raise them the matter becomes difficult. In California, the best and healthiest feed for pigs after they are weaned is alfalfa. On this they will grow and fatten with but a small ration of bran and chops stirred in their milk morning and night. Now and then add a little wood ashes or copperas water to cleanse the stomach and bowels. Have a clean place to rest them at night, where the rain and wind will not give them cold. Keep plenty of clean water on hand for them to drink; watch their tails that they curl, and their hair that it lays smooth and glossy. Never feed the refuse from hotels as it breeds hog cholera. When your pigs reach four months, begin to feed them barley to strengthen the bones and add firmness to the meat. At six to eight months your shoats should be ready for market.

Write M. Bassett, of Hanford, Cal.. about stock. Remember one thing it doesn't cost as much to fatten a well bred pig as a runt and the satisfaction of caring for the former is the difference between the good and the bad.

BEAUTIFUL CHRYSANTHEMUMS.

The cuts on the first page of cover of last week's paper gives a faint idea of some of the latest productions of chrysanthemums, and will remind those who were at the fall meeting of the Southern California Horticultural Society and others who were fortunate enough to visit the Pomona Nurseries, of the magnificent flowers grown by Mr. William Marugg.

These engravings were made directly from photographs of Mr. Marugg's flowers, and it was by oversight that we failed to give credit to him for the use of the cuts.

The largest apple orchard in Southern California is located in San Bernardino county near Victorville, and consists of 400 acres.

M. D. Whitcher of Los Olivos, Santa Barbara county, breeder of fine Italian queens is advertising on another page. Bee keepers will find his queens give good satisfaction.

S. W. Morgan, of Sunnyside, San Diego County, is advertising standard white Minorca eggs in large or small quantities in this paper.

White Minorca. Buff Orpington and Indian Runner duck eggs are advertised by H. C. Boyer, of Toluca.

J. E. Beadle is advertising S. C. White Leghorns and Indian Runner ducks in this issue.

When you get it it grows—Lilly Japanese Honeysuckle root. See advertisement on page 273.

A Poet's Heart

"I know you are a fraud," she said lightly.

She had a little thin volume in her hand. It was daintily bound. A gold daffodil, prim and shy. stood in silhouette on the cream cover. In the lower right-hand corner was the poets name, also in gold.

"I have always known that you knew," the Poet answered, gravely. "You have a habit of seeing our souls. It is disconcerting to us."

Then they both laughed, his laugh as gay as hers.

The room had the mid-afternoon sun It streaked it prettily, playing hide-and-seek with the blue china in an old oak bureau.

"Daffodils" she read with a pretty scorn. "And full of dainty love-songs. Are you not ashamed of your fraud?"

"They are real love songs," the Poet offered in defense.

"No, no. They are what you fancy should be real. You have smelt the fragrance of a thousand blossoms in love's garden—but you have always been on the other side of the wall."

"You will not even allow me a glance through the barred gate?"

"No, not even that,' she said, severely. "Philanderings and flirtations are but the faint whiffs of the perfume floating over the wall. They die very easily. I think you have no heart at all, Aubrey."

He grimaced disagreement.

"I am sure of it," she added, emphatically. "And yet you write—I am angry at every tear, and at every sigh, and at every smile, of which you cheat me!"

"But I do?' he asked, a trifle eagerly.

"Yes. But I feel the fraud all the time. Of course it is mostly myself. I think of Bob when I read."

"Yes, they all think of Bob," the Poet said, and if there was a sadness in his tone it was so very slight that it was unguessed by her. "Bob sells me. Bob is really a very useful chap."

"He comes home in a month," she volunteered.

"I am glad, Elf," he said.

She smiled at the term. It was the Poet's own, invented for her ever so long ago, at least two years before she married Bob, the Poet's friend.

"Of course you are. You are his friend—and mine. I have been outrageously lucky to have such a husband and such a friend."

"The friend is a fraud we determined."

"Not to me," she answered smiling. "You are quite transparent to me. I see all your little tricks—it is like standing at the back of you when you are acting to an audience in front."

He made a wry face and she laughed.

"Is it not good to be understood?" she went on rapidly, making a pretty play with flutttering hands and laughing eyes. "Aren't you glad that some one knows you quite intimately? There are so many who fancy they know the poet's heart, and I stand unseen and grin behind you because I know you haven't any at all. It is all art."

"You have found me out, Elf," he said, soberly. "It really is all art—all gold and cream and big margins and trick. Up here sometimes I have a regular orgie of being myself. No one sees me but the stars. I open my windows to them. and they are horribly shocked. and draw clouds over themselves quickly. I read evening papers and my bank book by the aid of a lamp that illumines and does not choke light."

She clasped her hands.

He took up the slim volume.

"These are well done, aren't they? We know that, and we know that they are frauds. Because I have no heart."

"Because you have no heart," the Elf repeated. "I wonder what it feels like. Is it like acting charades?"

"Not quite."

"But it is making beli [illegible]"

"Yes—in a way. It [illegible] lieve so well that sometim [illegible] see the garden although one is o [illegible] side with the bare, bald wall between. And no charades ever did the make-believe quite like that."

The Poet's voice had odd cadences in it sometimes.

"Perhaps some day you will discover it."

"Perhaps."

"And come into the garden. Bob and I will come to meet you."

"If you see me."

"Of course we shall see you.'

"There must be hundreds wandering round. let in on sufferance. The gardener has said to them, 'You can have a look r'ound, but you musn't touch.' That is depressing. I don't think you would recognize me if I were one of the depressed; I should be chastened by a humility unto which I was not born."

"And—Oh, what is that quaint old box?"

She pointed to the top shelf of the bureau. An ivory box, yellow with age, and carved all over by Indian figures and Indian patience rested there in an exalted loneliness.

"That," he answered, slowly, "is a box."

She laughed a happy. irresponsible laugh, with something of inquiry in it.

"It is a curious premature sarcophagus," he continued, with the wooden voice of a guide.

She wheeled around and stared at it.

"I do not know what you mean. But if you stand on this grandfatherly chair you can hand it down to me. Then I can hold its mysteries and know."

"You are like a huge bumble bee in the web of a diligent and respectable spider. You have broken down my little laborious web of mysteries all but one small corner. You must now know that."

"Then do more showman, please, before I go."

"My little ewe lamb, Elf. Steal not from me the last of my mysteries," the Poet implored.

"Before I go," she said severely, bunching into one small hand a parasol, a blue stoned chain purse with a defective catch, a handkerchief, and the little slim volume.

"It is a curious premature sarcophagus," he repeated, hurriedly. "It contains that which is more precious than the colors of a rainbow, and more beautiful than the lisped live words of fairies. It holds enshrined the heart of the Poet."

"It holds your heart?" queried she, in a crescendo of incredulity.

"Even mine, Elf."

"But you have none."

"Not now. I keep it there on the top shelf. It was inconvenient. What can a poor Poet do with a heart? The great public would not like it, for it would creep into his songs, and we all know, oh, wise Elf! that there is nothing so unreal as the truth. So I took it out of my breast and put it up there in the ivory tomb. I am very proud, of it, because it proves that I was once as other men.'

"What use did you make of it, Aubrey?"

"The use that foolish children make of toys—I broke it."

"Nonsense! I believe it never woke."

"Perhaps not. But its dreams were beautiful."

"The tomb is empty. I am quite sure sure of it. You are only trying to forget that I am not an audience, but the Elf who knows."

"Ah, true—I had forgotten. The tomb is empty. But there is a fragrance of violets long since outworn. I beseech you, iconoclast of a bumble bee, grant me a fragrance to treasure in my tomb."

"Not even that," she answered, rigorously. "You must not make believe to me. Bob and I are practical people. We know the management and like to see the scene set. and all the jewels laid out in the rude glare of day."

"You have the real—let me, I beseech you, have a little fragrance with my make believe."

"Yes, I have the real," she said, with a low resonance of voice.

"If the Poet cheats the whole world, let him cheat himself."

"The tomb is empty. And I must go."

"The tomb is empty," he acknowledged. "Not even ashes."

She paused at the doorway.

"We have talked a great deal of nonsense,' she said. "It is refreshing to talk nonsense when one is practical."

"What can one talk but nonsense to an Elf?" he asked. And she went down to the world of purple haze and mysterious lights stringing the streets.

He went back and gazed at the ivory box. Some of the shadows had stolen into his face.

Two months afterward the Poet tried to do something only remotely akin to poetry anl failed. A small child, led by a butterfly followed her passionate desire across the track of a runaway horse. The child, unconscious of the danger, crosed safely. The Poet who cares for small people. clutched at the severing reins. He missed the reins but reached the last knowledge of all.

Bob came home gravely to Elf. He had been to the Poet's room.

"In his will,"—with them the Poet was always unnamed, for there was

Borax is well known as the world's greatest cleanser and most harmless antiseptic. 20 MULE TEAM WHITE BORAX SOAP is the only real Borax Soap on the market. It makes washing easy, makes clothes and dishes hygienically clean, leaves the hands soft and white. **Send for free sample** to PACIFIC COAST BORAX COMPANY, 114 Sansome Street, San Francisco, California.

only one he so intimate—'he desired a little carved ivory box standing on the top shelf of the bureau to be buried with him. I took it down and the lil opened. Inside was a water-color sketch unfinished. It was your face, Elf."

She opened her big blue eyes with sudden illumination.

"The tomb of the heart of the Poet," she whispered very softly.

So the Elf knew the last of the Poet's mysteries.—Madame.

THE CHILD'S BATH.

Too little attention is given to the child's bath. Mothers who are ignorant of the hygenic principles of restoring circulation. after bathing, too often lay the seeds of disorder in their little ones which develop distressing complications. The child should never be soused in a tub of real cold water. The temperature of the bath should be comfortable to the skin, not warm, but free from chill. Introduce the baby to the bath tub by degrees. Let it splash the water with it feet first and if it shows an inclination to withdraw quickly, depend upon it, the water is too cold for its sensitive skin. Do not permit the baby to remain in the bath for over four or five minutes. rub the body gently with the hands all the time. to keep up circulation. As soon as taken from the water throw a soft flannel wrapper around the body. The room should be warm and a sponge wet in cool water rubbed over the head and face. Rub the body dry with soft cloth then use the hands to promote circulation until the skin is aglow with a rich color. We must remember, however, that the skin of the child is sensitive and will not bear rough handling. Cleanliness is the first requisite in building a healthy constitution. The child if weak may be aided wonderfully by the bath or it may be harmed if proper precautions are not taken in the start.

HEALING POWER OF THE SUN.

People generally do not realize the power of the sun to heal.

Rays of the sun contain heat and chemical rays, as well as light rays. The heat rays act powerfully upon the glands and vessels of the skin, while the chemical rays influence the nervous system in a remarkable way. It is the chemical rays which cause so-called sunburn.

The sun is the source of energy in the world. The marvelous energy manifested in plant life is derived from the sun acting upon the green parts to organize and vitiate the elements of the earth and air into living substances. The same energy of the sunlight is essential to animal life, invigorating and vitalizing the tissues and quickening all the processes of life. The sun bath is now a well recognized and much valued therapeutic agent.

In this form of treatment the whole body is exposed to the direct action of the sun's rays. Persons who are not accustomed to exposure to the sun and individuals who have light hair and light skins, should make the first exposure to the sun of short duration —ten or fifteen minutes. Longer exposures are likely to produce sunburn, excepting the inconvenience occasioned by it. The pigmentation of the skin induced by sunburn protects the skin from further injury in this way.

The body may be exposed either in the open air or before a window. When the sun's rays are so intense that the heat is depressing, the heat rays may be filtered out by means of a blue-glass screen placed between the patient and the sun.

SCARLET FEVER GERMS.

In a farm house in one of the New England states a case of scarlet fever unexpectedly developed not long ago. On seeking for its origin the physician found that some old cotton quilts. laid away in the garret for years, had recently been taken down and aired and put to use by the family. These bed coverings it was remembered, had been put away after a siege of this disease. This is only one of the many instances that could be related. to show how long the infection agent retains its vitality, and how common a thing it is for scarlet fever to be disseminated by bedding and other objects These quilts should have been burned as soon as the first patients had recovered.

The children of a certain physician were one day allowed to unlock an antique secretary that had not been opened for years. In it they found tresses of hair that had been cut from the heads of children who died twenty years before of scarlet fever. In a few days they were both stricken with this dread disease. The ease with which this disease is disseminated is appalling. It has been known to be spread to a neighboring house simply from the airing of bed clothing in a window. Infected clothing should never be washed with any other. The disease has been transmitted in this way. A bouquet of flowers that was sent from a scarlet fever room to a hospital carried the disease.—Dr. Emma E. Walker in Good Housekeeping.

PAPER NAPKINS.

Everyone knows the value of paper napkins, and in many households the useful and inexpensive little squares have been substituted for linen napkins for breakfast and luncheon. A few independent souls use the paper napkins altogether for doilies as well as napkins. It remained for a school to introduce a new use for paper. The towels used in this school are all paper. They are about twice the size of the napkins. and are no heavier. Great bunches of them hang in the toilet rooms of the schools attached to hooks, something like those on letter files. About two of the towels are needed to dry the hands and face. After using they are simply crumpled and thrown into the waste paper basket at hand. The sanitary advantage of the paper towels for public washrooms, school and institution use is readily apparent. Why are they not just the thing for the kitchen? Purchased in quantities they cost about an eighth of a cent apiece, and the saving in laundering is even greater than the cost of buying.

Mrs. Gaswell—I wish I knew of something that would improve my husband's appetite.

Mrs. Upmore—I believe jiu jitsiu would help him.

Mrs. Gaswell—That's something I never heard of. How do you cook it? —Chicago Chronicle.

The teacher who opens the doors and windows of the school room each noon hour will have fewer absentees on account of sickness.

The Japanese home is seldom more than one story, and the rooms are separated by paper shutters or partitions which fit into grooves and may be easily removed.

"An' what will me wages be?"

"Six dollars a week."

"Thursday afthernoon an' evenin' off?"

" Yes."

"Does yez send the washin' out?"

"Yes. And we have no children. Is there anything else you'd like to know?"

"Let me see a photygraph av yer husband."—Cleveland Leader.

Eva—"Did you ever kiss a girl through her veil?"

Dick—"Yes, and got quite an impression.

Eva—"Of the girl?"

Dick—"No, of the veil."

The average woman is either worried to death because she has no servants, or because she has.—Philadelphia Record.

First milliner—I wish women had the right to vote like men.

Second Milliner—Why?

First Milliner—I think it would help our business if they bet hats on the election.—New York Mail.

A young man who wants to settle down should always be willing first to settle up.—Desert News.

The best way to close an argument with some people is to agree with them.

Look well to clean shoes and a new hat. These tell the story of good taste.

Teacher—"Who knows what triplets are?"

Teacher's Pet—"I know; two twins and one left over."—Woman's Home Companion for April.

This trade mark stands for unquestioned quality. It's found on every roll that leaves our factory.

Any one can lay Rex Flintkote Roofing. Full directions and everything necessary accompany each roll.

Rex Flintkote Roofing

Rex Flintkote Roofing is made of long fibre wool felt, chemically treated and covered with a water-resisting, acid, alkali and rot-proof material. It is unaffected by either heat or cold, contains no tar or paper, and is an effectual guard against fire rom falling sparks.

Send for **Free Samples** and learn for yourself why Rex Flintkote to-day s being chosen for all kinds of buildings under all climatic conditions in preference to all other roofings, irrespective of their name or price.

We want you to read our **Free Book on Roofing.** It will show you photographs of buildings like the one pictured above, which are proving our claims for Rex Flintkote Roofing.

Every dealer has it or can get it. Of course, it has imitators, the kind that costs about one-half as much to make and sells for a little less. A good dealer prefers the genuine; for a good dealer prefers your good-will to a questionable profit. Ask him to show you the trade mark. "Look for the Boy" on every roll.

Santa Fe

COLONIST RATES TO CALIFORNIA

Will be in effect every day, Feb. 15 to April 7, and Sept. 15 to Oct. 31, 1906, from all points in the east and south.

Following are a few:

Chicago	$33.00	Kansas City & Leavenworth	$25.00
St. Louis	30.00	St. Joseph & Atchison	25.00
Galveston	26.45	Council Bluffs & Omaha	25.00
Dallas, Houston and Fort Worth			25.00
Nearly all points in Kansas, Oklahoma and Indian Territory			25.00

Colonist rates are also in effect from all points east of Chicago and south of the Ohio river.

Santa Fe Agents in California will take deposits of money to cover price of tickets, which will be promptly furnished to passengers at any point from which these rates are in effect.

California illustrated literature mailed free to any address or may be had from Santa Fe representatives.

Tourist Sleeping Car Lines

Colonist tickets are honored in tourist sleeping cars which run via the Santa Fe to Los Angeles and San Francisco.

Widen The Circle

There is no better way for the farmer to widen the circle of his influence than to join with his neighbors in building a telephone line. It extends the neighborhood circle and enables each one to receive advantages that cannot be had in any other way. The cost is meager compared with the benefits of a good telephone line, and progressive farmers, who are awake to their own interests, are building many such lines.

Stromberg-Carlson Telephones

are used on nearly all farmers' lines because they have been found to be the most suitable telephones for that purpose. It don't pay to experiment when you can get Stromberg-Carlson Telephones and be sure of good service. Start off with the best and your line will always work satisfactorily. You will also avoid the expense of changing instruments in a few months. Book 71-I, "How the Telephone Helps the Farmer," tells how to organize, build, and operate a farmer's line. It's free, and every farmer should have a copy.

The price of desirable grades is nominal at 8@12½ per lb., according to quality.

CITRUS MARKETS

NEW YORK, March 20.—The orange market has not fluctuated much in the week just closed. Sellers have had the advantage of good weather all the week and business has been on a substantial basis. Outside buyers have been moderately numerous and there has been a good city trade. The result has been that the market has been fairly active and prices have rules steady and higher than they were the week previous on an average.

California navels have continued strong and active under this satisfactory demand and situation. There has been a continuation of the pre.ious good market and the week closed with no accumulations and with sales more than up to the average. Another thing has helped the market The arrivals are running uniformly lighter every week, as compared with last year at the same time. The strengthening of the market due to this season has created a better feeling all along the line and there is much enthusiasm regarding the continuation of the present good conditions and possibly an advance in prices as the season proceeds.

Fifiteen cars were sold at auction today. The market is very strong. The weather is favorable. The auction sale of foreign lemons has been postponed until Wednesday.

Lilly plant roots are not sticks but roots. They are fibrous and they grow. See advertisement of Japanese Honeysuckle, page 273.

The foreign market will be exceptoinally good this season. Already large orders have been placed with the Eastern dealers by the wholesalers of Germany and other European countries. Germany has taken the lead thus far and promises to greatly surpass her imports of prunes for last year. The California prune has won great favors with the people of Germany, and they are willing to pay the prices asked for the goods. England, too, has already sent in orders to Eastern representatives and she will import heavily of California dried fruits. The price promises to be good this year because of the new demand.—California Grocers' Advocate.

Cold weather and storms at San Jose have injured apricot and prune crops considerably.

A Better Way
To Go East

Than is offered by the Salt Lake Route may be available some day but not at present. Let us suggest some reasons why you should go that way on your next trip.

Because, if you came west via the Salt Lake Route you must have been so well satisfied with the service and comfort enjoyed that you want to return the same way.

Because, if you came west some other way you surely should return via the Salt Lake Route to see a different part of the country.

Because, it traverses a country full of interest, pictiresque and unique in many ways.

Because, it is the short line via Salt Lake City, where you may stop and see the sights of that Mormon city without extra expense.

Because, it runs the famous "Los Angeles Limited," one of the finest and fastest trains in the west, carrying both standard and tourist sleepers through from Los Angeles to Chicago via Salt Lake City, Ogden and Omaha. Therefore, if you prefer to travel in a tourist sleeper you may go just as fast as the passengers in the standard cars, and considerably cheaper.

Because, on the "Overland" are standard sleepers through from Los Angeles to Ogden and Denver and tourist sleepers through to Denver, Omaha, Kansas City, St. Louis and Chicago, over the various lines east of Salt Lake City, enabling you without change of cars to see Rocky Mountain scenery to your heart's content.

Because in both trains are run Dining cars in which are served excellent a la carte meals, whitch may be enjoyed at your leisure; no short stops at stations for quick lunch.

Because, well there are other reasons which any Salt Lake Route Agent will be glad to explain to you. Just call on the nearest one for more particulars, literature, etc., or write

Gasoline
Engines
For Irrigating.

THE I. H. C. Gasoline Engines are especially adapted for irrigating purposes.

They will be found safe, durable, simple, and economical.

With maximum power, they can be operated at a minimum expense.

Expert knowledge or previous experience not required to operate them.

They can be attached to any kind of pump in any position, for raising water from deep or shallow wells, reservoirs, canals or running streams.

They excel in full, regular and long sustained power.

They can also be used for a general purpose engine for sawing wood, churning, cream separating, feed grinding, etc.

They are unequaled for power of all kinds.

Made in variety of sizes and styles:

Vertical—2, 3, 5 Horse Power.

Horizontal—(Portable and Stationary), 4, 6, 8, 10, 12 or 15 Horse Power.

An engine of this description, with a suitable pump, makes agriculture a success where it would otherwise be impossible.

Call on local agent and examine these engines or write nearest general agency for illustrated catalog.

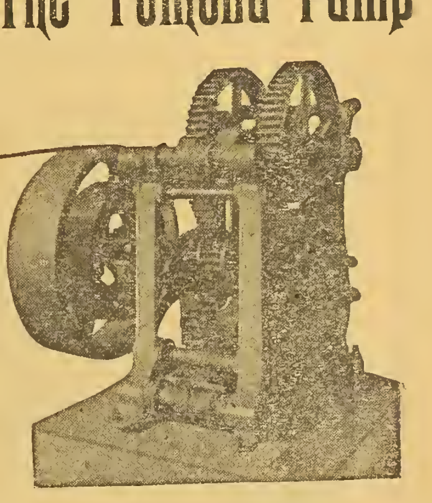
The Pomona Pump



PORTERVILLE, CAL. Mar. 1st, 1906

The Pomona Manufacturing Company of Pomona California installed a deep well pump for me last October consisting of a No 28 head and 10 inch cylinder placed ninety two feet below the surface. It lifts fifty five inches of water from seventy five feet or more below the ground and forces it through a pipe line one half mile long sixty five feet above the pump. It has been run for four months and has been using about twenty six horse power for the whole plant.

The pump has run without any delay or repairs of any kind and is satisfactory in every respect.

CHARLES BOYDSTON.

The above Pump was installed where the owner had been using a Centrifugal Pump and had been paying for 41 Electric Horse power and obtained less than 50 inches of water, making a difference of 15 horse power, saved by the Pomona Pump, or a saving of $750 per year for power alone.

We have saved this for Mr. Boydston. We may be able to do it for you.

Malthoid Roofing

is made by the original makers of P & B Ready Roofing which they began making in 1884. The same company has been studying the roofing question ever since, and perfection has been reached at last, in Malthoid which is the

Result of 22 years' experience

It is the best ready-to-lay roofing on the market, both in the material that goes into making it and the knowing how to make a roofing which will make a roof weather and water-proof; that will stand heat and cold; resist fire; and make the building it covers warmer in winter and cooler in summer. Any one can lay it. It is the only roofing that meets all cases.

How about your hog house, for example? It pays to have a good warm hog house. Why not cover it over—roof and sides—with MALTHOID? It will be absolutely dry; no wind or snow can go through it. The loss of one hog will cost you more than the cost of the MALTHOID to cover it. How about the poultry house, too? Will it be warm enough in zero weather? No building is too good to be covered with MALTHOID; it is so cheap it can be used on any shed.

GOOD TYPE OF THE MORTGAGE LIFTER.

Secretary Wilson of the Agricultural Department at Washington, puts the hog second in point of agricultural profit among the farm crops of the country.

For the past quarter of a century the Middle West farmers have been pushing the hog industry with as great activity as they have the cattle interest, and today they are rewarded in a greater percent of profit than is received from any other crop.

In California the hog and hen are forging to the front in the same ratio of excellence as they are in the East, with absolute certainty of becoming the staple industries of the State.

NOTES FROM EL CENTRO.

I have been living for some little time now at El Centro, California, in the Imperial Valley and have noted nothing in your columns in regard to the rapid growth and development of this place. There are some things here quite worthy of mention.

A very commodious and up-to-date ice plant with creamery and cold storage in connection is being constructed here and it is intended to have it ready for operation by the middle of April.

There is a flourishing creamery Association here and they have pledged the milk of a thousand cows for the prospective creamery.

A melon association of forty-five members has recently been organized and at least four hundred acres of cantaloupes are planted in this immediate vicinity by its members.

The melons will be packed by the association in a uniform style, plans for a substantial packing house being already completed.—J. O. B.

AN OLD, OLD STORY.

Fullerton, Cal., March 3, 1906.
Cultivator Publishing Co:

Will you please remove my half inch advertisement and send bill to date. Have sold all the stock I have to spare and booked orders for all first clutch of eggs. I have lots of stock for eggs and thought I would be able to supply all applicants, but evidently when one advertises in the Cultivator they should first double their supply. Yours very truly—Mrs. N. Frank Morse.

BARBED WIRE FENCES.

The man who uses ordinary soap for shaving will soon find out how a horse feels when he gets mixed up with a barbed wire fence. You can buy a new horse but you cannot buy a new face, no matter how irritated or blotchy it gets or how badly it itches. Avoid laundry or toilet soap for shaving as you would a barbed wire fence. William's Shaving Soap is made especially for shaving and in another column of this paper is an offer of a free trial sample. "For the sake of your face, try it."

E. M. Burnell of South Pasadena, Cal., is offering his entire flock of Buff Orpingtons for sale. Mr. B. is one of the leading and reliable fanciers of Southern California and his stock has a fine reputation. See his ad in this issue.

Wm. B. Dean, whose establishment was burned out a few weeks ago is now located at 2213 Central ave. Los Angeles where he is better located than before in the manufacture of Dean's Pacific Incubators and Brooders. His new catalogue containing illustrated and descriptive matter gives fully the reasons for claiming that the Pacific is the best and cheapest machine for the production of chicks on the coast.

If you want first class S. C. White Leghorn eggs or stock, write L. D. Pettit, manager Monte Vista Poultry Farm, Corning, Cal. His advertisement appears on another page of this paper.

PORTABLE BUILDINGS.

The Burnham-Standeford Co. of Oakland, California, advertise their portable buildings, of various designs in this paper. The firm is an old one, well established and are shipping all over the State. The buildings are inexpensive, made from first class materials and give the best of satisfaction. They build anything from a church to a poultry house. Write them for their catalogue and prices and they will save you money.

A Few Remarks About the Care of Chicks

By W. G. Aldrich

Select your eggs from strong, mature matings, as free from contagions as possible. Then incubate as near right as possible, as it is an easy matter to ruin your chicks by improper treatment during this period; don't crowd, or try to improve your machine, but adhere strictly to the instructions.

When your hatch is done, kill all the cripples and drags, as they are no good and are a nuisance to the others. This should be done as you remove the chicks to the brooder.

TEMPERATURE OF BROODER

Most people heat to 90 degrees, but I prefer only 80 to 85 degrees. Then look to the comfort of the little ones, just the same as you would to a child. I start to feed with charcoal and fine grit about 12 to 15 hours after the hatch is done. by throwing it loose in the brooder. Then in about 12 hours more, start with Coulson's Special Dry Ready-Mixed Chick Feed, in a litter of cut straw; keeping clean, fresh water constantly at hand.

Then the first consideration is cleanliness, which is the keynote to the Poultry Industry from "A" to "Z". Old and true is the saying: "Cleanliness is next to Godliness." It certainly is in the chicken business.

CONSIDER THE HEAT

The regulation of heat is the regulation of comfort. Strive to keep the little ones contented. People are apt to overdo the heat, and keep the brooders TOO WARM at night; not so in the daytime, as the chicks are out and in all the time. But at night the birds themselves, maintain the warmth in the brooder, but as soon as they leave the brooder in the morning, it cools off. Then the heat must be turned on early, because if the chicks return to a cold home, they will crowd together, and pile up, in their efforts to get warm. and then look out for trouble. At night turn the blaze of the lamp down real low, just low enough so it don't go out. Then the first thing in the morning when you get up, go out and turn up the blaze, so as to warm up the brooder; so that it will be warm enough to be comfortable for the chicks; say about 85 degrees. By experience one can tell by placing the hand in the brooder, whether it is comfortable for the chicks or not.

In the rainy season I keep my brooders warm all day, even until the birds are quite feathered, but put out the blaze about half past four or five o'clock, before the chicks go to roost at night, so as to let the brooders cool; because if they find it too warm, they will not go in, and in case they do stay outside, they will get too cool. Before morning, they take cold, contract Roup, get sick, and die off, or droop around and make no growth. They must be kept in comfort or they will not do well, and will not thrive as they are expected to do.

ALWAYS GET THE BEST

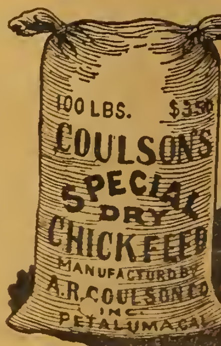
Do not try to be too cheap; get good feed (Coulson's Special Dry Chick Feed), good oil, disinfect often; do not let expense stand before comfort. (A good disinfectant to use is Coulson's Lice Killer, sprayed with an Atomizer Spray Pump.)

No matter how good and strong your little chicks are today, tomorrow may see them off wrong, without any apparent cause, but there is a cause, just the same. Perhaps, worms have attacked them, so give them a little Coulson's Roup Cure in the water, about four to six drops to each quart; start when they are three days old, and continue for three weeks. Along these lines you raise around 75 to 80 per cent of them.

People will find that different lots of chicks will require a little difference in temperature, but strive to keep them comfortable; be sure to keep them clean, and the rest is easy.

MORE REMARKS ABOUT THE FEED

Feed the Coulson's Dry Chick Feed four or five times a day for the first ten days; after they are two weeks old, feed them one meal a day of Coulson's Growing Chick Feed, and three times with some of Coulson's Special. When they get to be two months old, feed Coulson's Growing Chick Feed, by wetting it with milk or water, to make a mash food and feed cracked wheat or whole twice a day. When they are three months old, they can be fed the same as the hens, Coulson's Egg Food, in the morning, and wheat and other grains for the other meals.



One Cent

a chick is all that it costs to feed the chick the first 25 days on Coulson's Special Chick Feed. Ask your dealer for it.

The Silk Worm Industry in California

By S. R. Bellany

During the past summer I was led to make some experiments in the production of silk in Sacramento and the results have been so very much better than I had expected. that I am anxious to impress upon the people of this State the fact that they have in sericulture a great and as yet untouched source of wealth. I was led to make this experiment from the fact that I have been for years convinced that the climate of California was especially adapted for the cultivation of the silkworm and its product, and the results have been a surprise even to myself for they exceeded my most sanguine expectations. It is in order that more may become known of the possibilities of this great industry that I present to you today a brief review of my work. with some facts and figures bearing on sericulture and its posibilities in California.

I was born and raised in the southern part of Switzerland where silk raising is carried on, on a large scale, and the fascinating nature of the work after many years is still in me. I found a fair supply of mulberry leaves in the streets of Sacramento and started in silk raising, and to my surprise I met with the most encouraging results, seldom met with in the silk-raising belt of Europe. Expert sericulturists in Europe consider they have a good crop when they lose from twenty-five to thirty per cent. of the worms; notwithstanding that I labored under difficulties, in a house not equipped for the purpose, and the trees where I gathered the leaves for feeding the worms having been neglected for years, yet with all these disadvantages, I have not lost a worm, and they spun a solid cocoon with a fine grade of silk that cannot be excelled anywhere.

Silk raising could be carried on, on a large scale as well as in a small way for there is no limit to the amount of worms one person can care for in a suitable room fitted for the purpose

Raising silkworms on a large scale could be carried on as follows: Set two ozs. or more of silkworm eggs in an incubator about the time the mulberry leaves begin to grow out. In three days the eggs will have hatched out and the rearing will then be in progress; in a week or ten days place another two ounces or more of eggs in the incubator and continue the propagation till about the middle of August, or as long as the season will permit. Within fifty days the first set of worms will have spun, and on an average one hundred and twenty-five to one hundred and fifty pounds of green cocoons per ounce of silkworm eggs can be produced. In one ounce of silkworm eggs there are about one hundred thousand worms, which will require about sixteen hundred pounds of healthy mulberry leaves for rearing them. Five or six mulberry trees of moderate size will grow enough leaves to feed the worms from one ounce of eggs.

Morus albus is the tree of the right variety. It is seedless, white, and will grow anywhere. It is particularly adapted for field and farm border, but should be planted away from dust, on levee and river banks, and still better around homes. For myself, I would rather have the product from one acre of mulberry trees than of two acres in any other vegetation.

Silk-raising is an industry of such a fascinating nature, that I have no doubt the women of our farming classes would, in a short time, become as expert silk-raisers as their sisters in Europe; not only the farming classes, but our city women who depend on their daily toil, when their labor is not wanted at other enterprises, will find profitable employment at home, and I think to better advantage, particularly those families who have school children, who could before and after school. gather leaves for the silk spinner. It would be a matter of only a short time when the young generation would understand the silk worm's ways and the foundation of an important industry will then have been laid. never to be shattered. It is an easy task for three or four expert hands to raise from one to two tons of cocoons in one season. I would be willing to furnish any one who wished to engage in silk raising with the required amount and grade of silk worm eggs, and the proper in- them successfully, and I would be contented with a part of the product for my compensation.

In order to progress with the industry a filature, or reeling factory should be established so that the cocoons could be reeled into raw silk and to which the green cocoons could be shipped. I do not believe that there is a filature in the United States with the exception of a small experimental reel at the Agricultural Department, Washington, D. C., for I, with the assistance of the Sacramento Chamber of Commerce, have searched the country from the Pacific to the Atlantic Coast, looking for a filature, so that I could have some of the cocoons which I raised, reeled, in order to have an American flag made for the Admission Day event, but, to my disappointment, we could not find one. In the United States there is no market for cocoons, but there is a market for raw silk. The U. S. Department of Agriculture at Washington, D. C., offered to buy the dry cocoons at 75 cents to $1.00 per pound. I have been informed by a European sericulturist that this sum is less than the foreign market price for cocoons, but a market for cocoons could be made by establishing a reeling factory.

Courtesy Sonoma County Board of Trade

Sonoma County Potatoes, Grown Without Irrigation.

Bounty on Cocoons

The raw silk market in the United States would naturally control the cocoon market, but it does not, according to the statistics of the last census, in which the raw silk market of 1900 was $4 per pound. According to that, dry cocoons should be worth at least $1.50 to $1.75 per pound. Such a price may not be enough to encourage silk raising, therefore I would suggest that the State ought to pay whatever would be the difference between the market price of 75 cents to $1 per pound for green cocoons, and price of raw silk. Such a bounty should be maintained until the industry will have developed to such an extent as to fairly supply the market demand at which time it could be discontinued, and a good market for cocoons, raw and manufactured silk will be awaiting us. From the report of the last census it appears that in the neighborhood of sixty million dollars per annum is paid out for imported silk. Why should the United States pay out that sum when California itself could raise forty million dollars worth of silk without in the least interfering with the other industries.

All countries where this industry has become established have been compelled to foster it in its infancy. France did so for a long time and now is reaping its rich reward, for in silk reeling alone, employment is furnished to not less than fifty thousand women and children. Hungary, not many years ago, established its filature and silk culture station. Even in Japan, where the people are earning fifty millions a year in silk culture, the government has its filature and in other ways helps the people to help themselves by its fostering care of this great national industry.

Continued on Page 306

Deciduous Fruit Culture

BY J. W. MILLS, POMONA, CAL.

BROWN ROT IN APPLES.

Editor Cultivator: Will you please inform me through your valuable paper, what is the matter with some of my winter apples? They have little brown spots or streaks through the apple but they never reach the core. It tastes like rot and resembles wormy potatoes very much.—Subscriber, Los Alamos.

You have a fungus that is causing your apples to rot and the only thing for you to do is to spray with Bordeaux mixture. Spray your trees now and again when the fruit is set. The mixture is made by dissolving five pounds of bluestone and five pounds of lime in fifty gallons of water.

FULLER'S ROSE BEETLE.

Editor Cultivator: Will you please tell me of any spray I can use on blackberry bushes when they are in bloom? Can I spray with Paris green without danger of poisoning the fruit spraying to be done while the bushes are in bloom?—R. E. L., Merced.

Paris green applied at blooming time will not poison the fruit but it is liable to injure the bloom. The best way to get rid of the beetles is to tack some sheets of tanglefoot on a light board frame. slip it under the vines and tap with a stick which will cause the beetles to drop. Do this a few times in the morning and you will soon get rid of them. You will have to have two sets of sticky paper, one on each side of the bushes.

PRUNING PEACH TREES LATE.

Editor Cultivator: Kindly tell me in your next issue if it will injure peach trees to prune them now?—Subscriber, Pasadena.

It will not hurt your peach trees to prune them now. Now is the best time The later the pruning is done, the quicker the wounds will heal.

BERMUDA GRASS.

Editor Cultivator: What you say about Bermuda grass is very interesting, crop value, etc. But the kind of land, water, dampness, etc., are Sacramento conditions and not Southern California conditions.

What we want to know is: how will it do on our damp (not over-flow) river bottom, sandy lands; how will it do on our alkali lands (they are damp too); what is the growing season; how many head of stock will it pasture? Take the country west of Los Angels; there is lots of both sandy river bottom land, and more of damp alkali lands, (salt grass lands) I understand there are good Bermuda grass pastures around Fresno. If we could use our waste lands for Bermuda grass, the butter, beef, etc., production could be doubled or more Kindly look the matter up very respectfully,—H. W. D., Santee.

Bermuda grass will stand as much alkali as salt grass when it is once well established and will grow on some of the strongest alkali lands on the desert, in fact it has taken possession in such places where moisture is present, to the exclusion of other vegetation. The growing season is from the time that cold weather ceases in the spring till it comes again in the fall.

GRAFTING WAX.

Editor Cultivator: Can you supply a recipe for making a liquid wax for grafting and covering cuts in trees, and oblige—W. C., Duarte.

Melt one pound of resin over a gentle fire, add to it one ounce of beef tallow and stir well. Take it from the fire, let it cool down and then mix with it a tablespoonful of turpentine and after that add seven ounces of strong alcohol. The alcohol cools it down so rapidly that it will be necessary to warm it again, stirring it constantly. Care is necessary to avoid igniting the alcohol.

Apply with a brush and keep in a tightly corked bottle.

PLANTING A VINEYARD

Various articles relating to starting a vineyard have been going the rounds of the press and we have been asked if we are sure that we are right in advocating the planting of rooted vines rather than planting the cuttings just where we want the vines to grow. Growers who have had experience claim that it pays better to plant cuttings in vineyard form. We are confident that planting rooted vines is the best plan. Young vines with a good and symmetrical root system will out-grow a cutting. With the best of care. 95 per cent is a high average for cuttings, while 99 per cent is not high for rooted vines. One hundred per cent is not uncommon. This difference of 4 per cent on five tons per acre not a high yield for table grapes,—means a difference of 400 pounds of grapes per acre. Good table grapes are worth at least one cent a pound which means a loss of $4 per acre. This $4 will about pay for the cultivation. It costs just as much to cultivate the vacant places as it does when the vines are in.

The argument is advanced that a year is lost, but remember that with vacancies amounting to 4 per cent, from $2 to $4 per acre are being lost as long as the vineyard is maintained, besides think of the time that was lost before the vineyard was planted at all. The chief disadvantage in having an uneven stand is the feature of having an incomplete job always before you. There is considerable satisfaction and an excuse for pride in having a plantation as near perfect as possible.

The good prices realized from table grapes during the past few years will cause much planting during the next two or three years. There will as usual be a certain percentage of mistakes made and questions directed to us indicate that there will be considerable experimental planting.

Certain districts have made a reputation on certain varieties and those prospective growers who are somewhat removed from these districts and expect to have a satisfactory results are liable to suffer loss. For instance, we have received inquiries about planting Cornichon grapes in a sandy, gravelly soil, manner of pruning to make them bear good crops, etc. This is without doubt the case of a man having read the results obtained by some grower who has made money on that particular variety. It is not likely that he conceived the notion of planting them, from any other source. Experience will teach such experimenters that the soil will have to be consulted before the plants. Lodi Tokays and Fresno Emperors have also started the idea that there is money in these varieties where ever they may be planted. When the growers around Fresno first made known the large profits realized from their Emperors, several vineyards of this variety were planted in the light sandy soil of the San Bernardino valley. There has never been any flattering results from this and it would be strange if there would be.

Some five or six years ago, there was quite a stir among grape growers in Southern California over the subject of resistant roots, those which resist the phylloxera. This has died out and practically no more attention is paid to it. At that time, St. George was considered the best resistant stock. it making the most vigorous growth and being quite resistant to the insect that attacks the roots. The experience of growers in France showed that the St. George gave better results for all classes of soil, than any other variety of stock.

About six years ago we gave to a Pomona orange grower who wanted to plant a corner to table grapes, a few St. George vines, advised him to plant them and graft what varieties he wanted, onto them. This he did and he now tells us that his vines have made a fine growth and bear fine crops. He is out practically nothing for his extra trouble and is secure against phylloxera should it ever invade his neighborhood. Had he a large vineyard from which he would have to derive his income, he would surely have a decided sense of security.

These remarks presuppose the invasion of phylloxera. Is it impossible for us to get it? We guess not. The French got it from America and it originated in our native grapes which grow in our canyons and river bottoms.

There is another resistant root which is now claimed by authorities, to be partly at least, resistant to the dread Anaheim disease. It is Lenoir. It must be understood, however, that the varieties which are desirable to graft on Lenoir are not immune from the Anaheim disease, and varieties grafted thereon are subject to the Anaheim disease.

It might be well for grape growers not to lose sight of the dangers of planting vines on their own roots. It has ruined more than one grape grower.

OLIVES AND FIGS

There has been a great interest taken in olives and figs in the upper country this season and much new acreage has been set out to these two fruits, both of which have done well in most sections. There hase been such an active demand for olives for pickling, which, with good crops and fair prices, has had the effect of turning attention to the olive, while the marked success of the Smyrna fig, since the introduction of the Blastophoga, has served to bring that fruit to the front. All through both the San Joaquin and Sacramento valleys there are very large areas of excellent land suited to these fruits, and the climate is perfect for them. It is not likely that either ill reach the orange, prune or raisin, in importance, but the olive and the fig, from present indications, will before many years take no mean rank among our fruit products, stepping up very close to the front.

We sell country lands. CHATFIELD & VINZENT, 228 Montgomery St., San Francisco, Cal.

Practical Farm Science

BY PROF. A. J. COOK

BEE STINGS.

There is among those who have never handled bees a very needless or unnecessary fear and dread of stings. The pain when one is stung is so sharp and severe and the sting comes so quickly that anyone who has been once stung is likely to regard a bee as never safe unless dead or distant. Indeed this unnecessary fear undoubtedly prevents many from becoming beekeepers, who would otherwise be lured into this fascinating realm of work and study.

I have known people to whom the poison is so terribly virulent that I do not think they would be warranted in keeping bees or in having anything to do with them. Such persons stung even on foot or hand would not only suffer terribly and be prostrated for days but rash would result which was very irritating and the eyes would swell shut. I have known one case and heard of more, where a person especially susceptible to this bee poison died as the result of a sting. Such cases are however, very few and so exceptional that they are of no practical interest to but very few of us.

To most, then there need be no hesitation to keep bees because of the sting. Bees are rarely moved to sting if one handles them carefully and avoids all such actions as we soon learn will cause irritation. Although I was very nervous and afraid of bees when I commenced to work with them I very soon lost this fear and in a very short time was no more reluctant to go to my bees than to my horse or cow. After my first week or two, even the gloves disappeared and while I have usually protected my face by a bee veil, yet I have worked with the bees hours and days together, without even this protection. I feel sure our country would greatly profit by having more beekeepers. We are not only losing much honey when might be gathered but a much more serious loss is suffered from a lack of bees doing the necessary work of pollinating the flowers. If, then this dread can be removed so that more bees shall be kept, our country as a whole will be a great gainer.

The important caution to be observed in handling bees is to make no quick motions. Violent, nervous, thrusts madden the bees and they are not slow to resent such affronts. Bees are very easily and quickly subdued by the use of smoke. This greatly frightens them and when bees are frightened, they always commence at once to take their fill of honey. With bees as with people, a full stomach is coupled with amiability. To use smoke we need only to blow a little into the entrance opening of the hive. The bees are alarmed and fearing robbery, they at once commence sipping the honey and the work of subjugation is accomplished. As I remove the cover, I usually blow a little more smoke among the bees, as this drives them down into the hive and further intimidates and makes them more peaceable.

In lieu of a bee smoker, a roll of cloth tightly wound so as to not burn to rapidly, will answer for smoke. We simply hold one end and fire the other. The bee smoker is, however, by far the best for this purpose, and should be regarded as an absolute requisite in all beekeeping. As a good one costs but a dollar, expense is no bar to this possession. The bee smoker consists of a tin fire tube with a funnel shaped movable nozzle. The tube is fastened to a hand bellows. As we

"Cleanse and disinfect thoroughly through the burning fuel in the fire tube and so we can fairly deluge the bees with smoke if we desire to do so. Usually, however, but little smoke is needed. I have often burned cloth in the smoker but prefer wood, attacked with dry rot. This burns slowly and without producing great heat, gives ample smoke. It is always desirable to have the smoker burning while we are working with the bees. Then, in case they seem angry, we can immediately subdue their irritability. In case we must handle our bees when they are idle, at which time they are likely to be very irritable, it often becomes necessary to use the smoker very freely.

* * *

CALIFORNIA AS A BEE STATE.

Mr. L. L. Andrews of Corona, president of the California Bee Keepers' Association keeps his apiary in two separate localities. In one location he secured fifteen tons of honey last season and in the other ten. As he had only two hundred and fifty colonies of bees we can see that this was a good yield. The honey was secured from orange blossoms and sage bloom. Some of his best colonies filled ten frame extractor supers, three times in less than two weeks, during the height of the orange flow. This certainly shows not only that California is an excellent bee state but that with strong colonies a large amount of honey may be secured from the orange bloom. Mr. Andrews keeps his bees in the regions of large orchards until the sage begins to bloom in June, when he removes them to the regions where there is abundance of sage and buckwheat. When we note that Mr. Andrews secured over two hundred lbs. per colony from his large apiary in this year which was not one of the best, we need say little more to prove that California ranks first as a bee region.

Do you get the **Price List** of the **IMPERIAL CASH STORE?** If not, better send for it today. The best, cheapest and most reliable Mail Order House on the Pacific Coast. 532 Washington Street, San Francisco, California.

Italian Queens

Stock your apiary with Italians and increase your honey crop. My queens will give you satisfaction. I am now booking orders for May delivery. Untested, $1.00; tested, $1.50. For large amounts write for prices.

M. D. Whitcher **Los Olivos, Cal.**

BEE TENT.

This is simply an enclosure made of wire gauze or cloth or both which we can place over the hive and in which we work as we are called to manipulate the bees. The cover is supported by a light frame. The one which I usually used is about six feet each way. This also seems to quiet the bees. In this enclosure they seem to lose all disposition to sting. This also serves to prevent robbing in case we must handle our bees when they are not gathering any honey. In times of working with bees that have foul brood, an oil cloth covering the whole space of the bee tent as a floor will greatly lessen the danger of spreading disease. I would not think of keeping bees without such a bee tent.

As I have frequently stated in these columns, Italian Carniolan bees are far more amiable than are black ones. For this reason, if for no other, I should always keep one of these races. They have other merit that make them desirable.

The Connecticut Commissioner f Domestic Animals examined 3603 cattle for tuberculosis last year, and condemned 587, allowing an average value of $12.54. The commissioner says it has been his aim to impress upon the owner the fact that the manger lately occupied by a tuberculous animal is almost sure to become contaminated and that a healthy animal would be likely to contract the disease if permitted to occupy the stall and eat from the manger before they had been thoroughly cleaned and disinfected. He adds "six good rules," viz:

"Admit as much sunlight as possible into the stable.

"Whitewash the walls, ceilings and stanchions at least once every year.

"Use common sense about turning cows out from a warm barn to stay in inclement weather.

"Make every cow in the herd occupy the same stall every time.

"Cleanse and disinfect thorourghly after removing a tuberculous animal.

"When you discover symptoms of tuberculosis, promptly call a veterinarian and have the animal examined."
—Country Gentleman.

California Horticulturally

BY JOHN ISAAC, SACRAMENTO, CAL.

SOMETHING ABOUT GINSENG

There are a great many people now inquiring about ginseng, and its culture, stimulated it would seem, by the florid advertisements of dealers who have seed and roots for sale, and who seem to be working the ginseng proposition as a sort of get-rich-quick scheme. Those who are figuring on going into ginseng growing should follow the advice of Punch to those about to marry, and "Don't." There may be one or two instances in which this plant has been successfully grown in garden form, but they are few and it is certain that, were it as easily cultivated and as profitable as the advertisers of seeds and plants assert, we should all be wild after it, for it would pay better than gold mining, and we could make easy fortunes at home and not have to face the dangers and uncertainties of the Klondike, or other forbidding wastes. To our California inquirers, at least, it is safe to say there is nothing in it, and they had better leave it alone. To be grown successfully it requires peculiar conditions of soil and climate, a deep, rich leaf mould, plenty of shade and moisture, but not swamp land. It is an exceedingly slow growing plant and no returns can be expected from it until the seventh year, and even then, under the best of care they will be light, while with a little neglect in the meantime, they may be nil. Ginseng is no new thing in America, but its value has been known for over a hundred and fifty years, and shipments have been made from here to China during all that time. Now, had there been such enormous profit in its culture, is it probable that it would have remained for our discovery at this late date? To all California inquirers our advice is: There's nothing in it; leave it alone.

* * *

.. A COSTLY INSECT PEST

A late issue of the American Cultivator, published at Boston, has a statement by Prof. Fernald, of the Gypsy Moth Commission, in which he advocates the appropriation of $200,000 annually to the work of fighting this one pest in the state of Massachusetts and claims that the work would be cheap at that figure in comparison with the losses incurred if it is left alone. A permanent tax of $200,000 a year to fight one pest seems pretty costly, and we cannot but regard our California method of not letting them get in, and of keeping down pests we already have by means of their natural enemies as much the cheapest and surest.

* * *

OLIVE AND COTTON-SEED OIL IN EUROPE

Consul General Skinner, of Marseilles, France, writes that there has been a heavy shortage in the olive crop in the Mediterranean region the past season, which is summarized as follows: France, half a crop; Spain, one third; Tunis, one-fourth; Northern Italy, one-eighth; Southern Italy, one third. There is, however, no danger that there will be any diminution of "pure olive oil" in the market, for the Consul-General, in the next paragraph, informs us that the imports of cotton-seed oil from the United States have increased enormously, being 175,695 barrels against an average of 75,000 barrels for the three previous years. About the only thing that can materially interfere with the olive oil output of the world will be the extension of the cotton-boll weevil and a serious shortage of the cotton crop.

* * *

GOOD CROP CONDITIONS CONTINUE

Reports from all parts of Northern California continue to predict an unusually good season. Rains have been abundant; almost up to the quantity of last season, and much more concentrated; the soil is filled with water, and there is no fear of its drying out before harvest, even should there be no more rain. Killing frosts have not occurred as yet, and danger from them grows less as the season advances. Many trees are in full bloom, while all fruit buds are well swollen. There is every promise at the present time that the fruit crop will be an unusually heavy one, and unless we get a timely freeze to help in the work, vigorous thinning will be necessary to secure marketable fruit. Grain is in good shape, and feed abundant. Altogether the season which opened so unpromisingly, is turning out one of the best on record.

* * *

A BACKWARD STEP

The Weather Bureau has stopped the issuance of its crop report and there is much ill feeling on this account among the more intelligent farmers, to whom they were some sort of a guide as to the prospects for the season. From these weekly reports growers were able to predicate whether crops in their line were going to be heavy or light, and whether prices were likely to be high or low. They served as a sort of business guide-post to them, and while necessarily somewhat vague, and not altogether accurate, were as good as could be, were gathered by a disinterested bureau, and were so far reliable. With them stopped, the agriculturist is left wholly at the mercy of interested parties for all his information, and this information will be garbled to suit the speculator, without a doubt. When the farmer is now informed by the middleman that there has been such an enormous crop of any article that he produces, that prices are low, he will have to take his word for it, and will likely sell his crop at a loss as he has no means to refute the statement. The movement looks very much like an effort to play into the hands of the speculator and once more offer the poor farmer on the altar of sacrifice. Secretary Wilson has always shown himself the friend of the farmer, but in stopping these crop reports we think he has made a serious mistake.

* * *

PREPARE TO FIGHT THE CODLING MOTH

Apple growers should have all their spraying outfits in readiness, a good supply of tested Paris green on hand, and be prepared to do vigorous battle with their greatest enemy, if they would gather any harvest. Nothing but the most vigorous warfare against this pest will prevent it from taking it all. Those who have established parasites in their orchards need not fear for them, as the parasite of the codling moth is a pupa parasite and does not interfere with the insect in its active stage; therefore it cannot be reached by any spray used againts the insect in its worm stage. Perfect cleanliness around the orchard and packing houses would do very much to check this pest, as it is in old fences, lumber piles, old boxes, cracks and crevices of outbuildings and similar places of refuge that it retires for pupation, and if it cannot find suitable resting places it does not thrive so well.

Dudley C. Moulton, who has been acting as County Entomologist of Santa Clara County for a year and a half past, and who has done some excellent work on pear thrips, has received an appointment under the United States Department of Agriculture as a field agent of the Bureau of Entomology.

BY J. W. MILLS

NEW VARIETIES OF ORANGES.

A few years ago there appeared an article on the subject of varieties of oranges that sized up the situation about right. It related how there had been a constant endeavor to secure an orange of merit that would prolong the season of the Washington Navel and also one that would come in ahead of it. It was not hoped that an orange of better quality than the Navel could be secured.

Mr. A. C. Thompson of Duarte, worked along these lines and claimed that he originated his Thompson's Improved by the manipulation of buds, uniting the qualities of St. Michael, Washington Navel and the Blood Orange.

Nobody doubts that Mr. Thompson worked conscientiously and hard on this problem but the writer of the article referred to, says that there is no evidence that Thompson's Improved is other than a natural variation of the regular Washington Navel. There is not the slightest resemblance to the St. Michael in the Thompson fruit, or tree. While the rind is smooth it has not the same quality. All of the fruits from which it is claimed this Improved variety came, ripen later than it does It is not an uncommon thing for all kinds of fruit trees to produce bud variations and the Washington Navel is noted for it. There is hardly an orchard of any size in which it is not possible to pick out trees that are totally different in character from the balance of orchards and the same may be said of its fruit. It has been our experience that occasional trees will produce nearly 90 per cent. fancy fruit while others will not produce any, and still they are all true Washington Navels. It would seem, therefore, that it is not improbable that while Mr. Thompson was searching for a superior Navel orange from which to create a superior strain, he simply continued to propagate its kind. Or it may have happened that he inadvertently took a bud that was one of those freaks that produce what are known as "sports" which in botany are known as bud variations. It is not a common thing to see the branch of a peach tree produce nectarines, but it happens once in a while, and after the tree has attained full size.

The merits of Thompson's Improved do not call for extensive planting as it is poor in eating qualities, being dry and full of "rag." It has been designated by some of our best growers as a "wooden orange" but still these qualities make it a good shipper if handled properly. The usual objection to it is the thinness of its skin. This is not a universal fault for it has not a thin skin in most places. It colors earlier than the regular navel and has brought good prices in the early markets. This variety should be planted in limited quantities in early sections for the holiday trade.

Navalencia was brought out by Mr. Thompson in the same way he did his Improved. It however, was not extensively planted and perhaps never will be. It has been our experience that none of these new varieties have the fine eating qualities of the true Washington Navel.

THE CENTRAL CITRUS BELT.

A few weeks ago the writer spent a day or two in driving through the orange groves of the central citrus belt in Tulare county, the active center of which seems to be about Porterville.

Nowhere in the State is there a section more full of promise to the orange industry or where natural conditions are more favorable to the production of citrus fruits at a minimum cost.

The chief facts in favor of this district, for they are facts, undisputed, are such as must appeal to all prospective purchasers of orange lands. Citrus fruits from this section ripen and are marketable so early that they do not come into competition with those from other sections of our State. Instead of having to ice their cars, as is the rule in most other parts, the shippers from the Porterville, Exeter, Lindsay districts send out their fruit from Nov. 1, to Dec 10, and consequently have to put a stove in each car to keep the temperature up. As a result this temperature is kept at a point so low that decay from the blue mold is an absolute impossibility, therefore losses from this source are practically none.

Both land and water are to be had in abundance at such low cost that visitors often wonder why the citrus industry there is still in its infancy. When one considers the extremely favorable natural advantages, he marvels that he cannot find orange trees from a quarter to a half century old.

To one who has traversed the fruit growing sections of our State it is a great source of pleasure to find a district entirely free from scale. In this respect this district compares favorably with any on the Pacific Coast. for nowhere could the writer find a trace of any scale on the citrus trees. The summers there are quite warm which largely accounts for the absence of scale, but such weather seems to be just what is required for the early ripening of oranges second to none.—E. B.

Horticultural inspector Day of Pasadena is reported to have stated that more than 1000 boxes of oranges have been taken this winter by tourists and sightseers. The loss to the growers, so far this season. is over $12,000.

The orange and lemon groves around. Hollywood are fast disappearing; as the result of the building movement in that district.

ORANGES AT IMPERIAL.

Editor Cultivator: Will you please tell me through your paper if you think it advisable to plant oranges in the Imperial Valley. The soil is good and water plentiful. The winters not very cold. Would you advise planting an almond orchard? An early reply is desired.—M. E. A., Imperial.

There is a possibility of big returns from oranges in the Imperial Valley, Try a few Thompson's Improved and a few Washington Navels. An acre of each will be sufficient.

Almonds are erratic things and are exacting in their requirements and we would advise you to plant not more than half a dozen trees of any variety.

The rains of the past ten days are said by fruit men to presage a great crop.

A FEW OF THE GOOD REASONS

ARMOUR'S BLOOD BONE AND SINEW FERTILIZERS

why you should buy the Armour fertilizers.
They are made, from the best materials obtainable, months before they are shipped out, thus being thoroughly cured and blended.
Each element of plant food is derived from a number of different sources of varying degrees of solubility, thus furnishing a continuous supply of plant food.
They back up our arguments with
The "Irresistible Logic" of Results.

The Ornamental Garden

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

THE NILE LILY

The African Lily (Agapanthus umbellatus), often called the Lily of the Nile, is an old garden favorite, its large umbels of bright blue flowers often standing one to two feet above the mass of strap-shaped leaves. That all are not successful with this truly meritorious plant is largely due to lack of water during the growing and flowering season. At this period, the surrounding soil should never be allowed to dry out. In addition to the type we have a variety with white flowers and one with richly variegated foliage, though neither flowers so profusely as the common one. These plants have been in cultivation for centuries.

THE HYACINTHS

The hyacinth family consists of more than thirty species, mostly from the Cape, though the parents of our common garden-hyacinths are said to hail from the Mediterranean region. Owing to the dryness of our climate the growing of these beautiful flowers is not an unqualified success unless special treatment can be given. In case of pot-grown bulbs, it is an easy matter to keep them in the proper temperature and condition of atmosphere. To insure success a good root growth must be obtained before the flower spike starts. By keeping the bulb in the dark for some time this root growth can be first started. For that reason, plant six inches deep, the roots will then have a start before the spike reaches the light. Hyacinths have been cultivated in Holland since 1600 and our principal supply of bulbs is still obtained from that country.

STAR OF BETHLEHEM.

Several Ornithogalums are found at the Cape, though the best one (O. Arabicum) is from the Mediterranean and this is the one best known in California. South Africa has the second and third best in O. revolutum and O. thyrsoides. The Star of Bethlehem, so common in our gardens, is O. umbellatum, also from the Mediterranean region.

A STRIPED GRASS.

Chlorophytum elatum is a very valuable and common plant and seems to do well in almost any soil or locality. It is especially useful in hanging baskets, vases, and rockeries. The most common form in California is the variegated one, each leaf having alternate stripes of green and white. There is also a variety called picturatum, with a yellow band down the center of each leaf. This plant for many years has been sold in nurseries as Anthericum vittatum and under this name it is still catalogued.

RED-HOT POKER.

One of the oldest garden favorites and one of the most striking when in bloom is the "Red-Hot Poker" (Kniphofia aloides). All of the many varieties of this plant are worthy, but the public has been deceived so much that but few can now be induced to buy varieties advertised as new. The truth is that to the ordinary observer "all red-hot pokers look alike" This plant is sometimes sold under the name of Tritoma Uvaria, and many give it the popular name of "queen's lily," while some varieties are known as "torch lilies."

OUR DRACENAS.

Several very showy Dracenas are found in South Africa, and few of our plant fanciers would place them in the lily family, but it is the composition of the flower that determines the order to which they belong, and not horticultural distinctions. Dracenas differ but slightly from the Cordylines and the plants known as the lily palm so common in our gardens and usually called Dracenas, are really Cordylines and the two best known here are from New Zealand.

THE LILY FAMILY.

It is a strange fact that the Cape region abounds in bulbs of almost every kind, yet it contains no true lilies; that is, plants of the genus Lilium. Though the typical genus of the order Lilaceae is wanting, the family is most generously represented.

PERPETUAL BLOOMS.

A. J., Santa Ana.—Such a list as you wish would require a considerable study to prepare and we have no data on hand that would aid in the work. We believe you could "work out your own salvation" in such a scheme by observing what is in bloom at differnet seasons. This is all we could do for you.

RURAL IMPROVEMENT.

In addition to the college course, agriculture must be taught in the rural schools. Children must early learn to see what is about them. Education opens the eyes of the blind and unstops the ears of the deaf. Teachers, it is your opportunity to work these miracles by pointing out beauty in the common things—the tree, the sky, the rock, the brook, the hillside and the meadow. If the child is taught early to love the things about him, it will be a joy to turn his hand toward their development. Then manual labor would not be a drudgery. One should experience as much pleasure in planning and caring for a garden is in the creation of a work of art.

Farmers, we are in reality educating our children for everything save that which they must actually do when they step out into the arena of life. You want John to stay on the farm; you want Mary to know how to carry on a well ordered home. They are sent to a country school, then to college. They receive their education. John understands astronomy and psychology fairly well: Mary has a smattering of French, and can play a Liszt rhapsody; but alakaday! John cannot stock a plow nor plant a garden; Mary cannot cook a meal nor clean a house.

Educators are seeing the folly of all this, with the result that manual training, nature study, domestic science gardening and agriculture have been introduced into city schools.

We need these studies taught in the rural districts, and farmers must get their heads together, vote a local tax and see to it that their children receive the right kind of education. "Just as the twig is bent, the tree inclines" The direction given the mind of a child determines his future usefulness as a citizen of this great commonwealth. In a democracy the stability of which depends upon the individuals who carry it forward it is absolutely essential that each unit should be sound and strong. The unprecedented development of the United States is due more to its free public schools than to any other agency. It is the right of every child to have an education. Ignorance is the cure for nothing.

If we would improve the external aspect of our rural communities, it must come as the result of education. A more intelligent understanding of the soil, of the care of live stock, will quickly manifest itself in improved external conditions. Indeed, this is the only way to secure rural improvement.

When you get it it grows—Lilly Japanese Honeysuckle root. See advertisement on page 273.

In the Vegetable Garden

BY ERNEST BRAUNTON

TOMATOES IN CALIFORNIA.

Tomatoes are grown largely in the State for canning, and for this purpose are usually planted to mature in late summer and fall, coming to the cannery after the fruit season is over and finishing the year's run. This may be called the main crop, and is grown largely in Alameda and Santa Clara counties, in the San Joaquin and lower Sacramento valleys, and in Southern California.

Very recently there has developed in certain practically frostless sections of Southern California, a profitable shipping trade in fall and winter tomatoes, the vines commencing to bear after the beginning of cold weather in the East, and continuing well into the winter without protection. In the usually dry, warm weather previous to December 1st a large amount of fruit, maturing abundantly in October, November and December or later, may be shipped East when the market is practically bare, and command a ready and profitable sale. This fruit is picked in a hard-ripe condition, carefully selected, wrapped in paper, and shipped in four box crates like plums or peaches. During the past fall nearly 500 acres of these winter tomatoes were in the La Habra district near Whittier mostly in young walnut orchards, and more in other sections about Los Angeles. With the canners paying about $8 per ton for the summer crop, the rates of $30 to $50 realized from winter tomatoes look very attractive and make the business profitable to the grower. The production is large and of good quality. Altogether the growing of winter tomatoes in suitable localities may be called a promising industry, capable of considerable further development.

In early spring tomatoes are planted by vegetable growers in many parts of the State, and these supply the local markets in the earlier part of the season. This business usually brings good returns, though the production is not so large as in the later crops.

GARDEN DRAINAGE.

When the size and place for the garden have been determined, attention should be given to the drainage, unless it is naturally very good indeed. The purpose is to get rid of an excess of water, which left alone, cuts off the supply of air from the roots of the vegetables and stops their growth The work must be done thoroughly before planting; afterwards no remedy can be found for a failure.

Surface drainage is frequently secured by use of beds raised above the level of the ground. While this plan has disadvantages, it is commended where no other seems practicable.

But really effective drainage must be underground, and tile drains are usually most economical. Where tile cannot be had, stones or brush may be placed in the bottom of the ditch. For most soils the ditches should be 3 to 4 feet deep and about 30 feet apart. They should have plenty of fall and be carefully leveled at the bottom. When the ditch is ready to fill, sods, straw, or paper should be put over the tile or stones to keep out the loose earth. A ditch can be dug in most soils with a spade alone if the digging is done so as to leave one edge of the spade free. This method of digging of course gives an advantage also in spading a hard soil for beds or other use.

Trenching will often take the place of drains. This consists of breaking up the soil two spades deep instead of one. From the top a spadeful of earth is thrown out and turned over. It is only lifted up a little and allowed to drop back into its place. This must be done, however, in a way to break up the earth thoroughly. Trenching needs to be done only every two or three years. It is especially useful when the subsoil is very hard or comes near the surface. Thorough subsoil plowing renders trenching unnecessary.

KILLING WEEDS.

Weeds will be most plentiful in the vegetable garden, when the rain is plentiful. The plow and hoe ought to be depended upon mainly. Hand weeding is necessary in some cases, but is always slow and tiresome. Various forms of cultivators and wheel hoes are in use and have many advantages over the ordinary field implements. Also, there are several forms of hand hoes made to cut just below the surface and kill the weeds more effectually and rapidly than the ordinary hoes will do.

Several kinds of grasses are the hardest to deal with when once they get set in the ground. The worst of these are witch grass and Johnson grass. Sometimes very troublesome are crab grass and Bermuda grass. The thing to do with these is to see that they are well killed out before the garden is planted and not to allow them a start afterwards.

TURNIPS.

For turnips, a rich finely pulverized soil is needed. A sandy or gravelly loam is preferred. The seed may be sown quite early, as the plants are not easily hurt by frost. Sow in drills 1 foot apart and half an inch deep, or sow broadcast and rake in lightly. If there should be no rain a thorough sprinkling will insure germination. The plants should stand at least 3 inches apart. Repeated sowings are necessary for a satisfactory succession in summer . White varieties are preferred for summer use.

GROWING SQUASH.

A warm, light, rich soil, deeply worked, is best. Plenty of stable manure will be repaid by increased yield. Plant summer varieties in elevated hills, 4 feet apart each way, as soon as the ground is warm. Place the seed upright, with the eye down, and cover 1 to 3 inches deep. Late varieties should be planted in hills 6 to 8 feet each way, leaving four plants to a hill. Another way is to plant in rows 12 to 20 feet apart and thin to 6 feet between the hills in the row. Early beans or peas may be cultivated between the rows, to be cleared away in July. Weeds must be kept down and moisture held by cultivation. The hand hoe must be used after the vines begin to run.

GROUND CHERRY.

This plant, also known as strawberry or winter cherry, grows wild in the fields of California. Its fruit is used for preserves for the table. A good soil well worked improves the quantity and quality of its production. It may be planted early in drills 3 feet apart, with 12 to 18 inches between the plants in the drill.

It is very productive and keeps a long time in the husk.

PLANT GUARANTEE.

The request to replace dead stock is one of the most annoying features of the nursery business. This request nearly always is made by those unacquainted with plant life. They purchase trees and plants without any thought of a possibility that some of them may die, and in their disappointment they reproach the nurseryman with the idea in their minds that their loss is wholly through some remissness of his. The intelligent buyer knows there is some risk of loss, and he understands he assumes that risk.

There is no reason why a nurseryman may not insure a lot of stock if he so desires, just as an insurance company would do. But the rule of the trade does not call for any insurance, being in this way on a par with all other lines of business.

The care taken to give good trees and plants and the expense of doing it as well as the expense of informing customers how to treat their trees in order to have success, costs the nurseryman as much as it would do to replace dead ones in very many cases. Look at the reading matter many catalogues contain bearing on this very subject of proper treatment of purchased trees; and in addition to this, some establishments issue little booklets gotten up expressly to convey such information to intending purchasers.

ACETYLENE LIME IN GARDENS

"I have used acetylene lime now for four years, but attach more importance to it for its value for killing and driving away the various insects such as slugs, grubs, etc., which frequently abound in some parts of the garden where it is especially shady or the aspect is north. I find it has no detrimental effect when applied to growing plants, and have tried it on cabbages, turnips, globe artichokes, and various other things, and have used it freely this season on canterbury bells which were badly infected with the leather jacket grub.

"However, I much prefer using it on vacant ground in the Autumn or early Winter and I have had very satisfactory results. The lime keeps the soil free from insects for at least two or three seasons, and, where applied three years ago, it is still freely seen in the soil. It should not be used too much on fast growing vegetables for kitchen use in case of unpleasant flavor. I find crops invariably do excellently after its previous application to the soil.

"Our refuse is drained into a large tank, together with the water which is used in cleansing the generators—the latter making it of a more moderate strength. If we wish to use it as a liquid it will easily mix by being stirred up, and is then about the thickness of lime-wash, which it much resembles. The liquid, however, can be taken off, and the lime used separately.

"If the generators remain for a few hours after the gas is made, the liquid, which is very strong and perfectly clear, can be taken off and used without any lime appearing on the soil. It seems equally harmless, too, in a crude state, even to very small seedling plants.—The Garden.

Lilly plant roots are not sticks but roots. They are fibrous and they grow. See advertisement of Japanese Honeysuckle, page 273.

Cuthbert Raspberry Plants
$1 per 100, $6 per 1000
Gray's Gardena Dewberry

A Big Seed Offer

Convincing Seed Buyers of the Quality of : : :

Taylor's Seeds

Try Seeds First, Then Send Money

In order to introduce our seeds as rapidly as possible we will, upon request, send one each of our specially arranged collections of choice vegetable and flower seeds. The quantities are proportioned and selected to give a continuous supply of flowers and vegetables of high quality throughout the season to those who do not care to wade through long catalog lists. So certain are we that they will give satisfaction, that we will send our collection of flowers, 14 varieties, and our vegetable list, 14 sorts, for $1.00, and wait for our pay until you have tested the seeds and proven to your own satisfaction that they will germinate and produce the results we claim. If they are not first-class you do not send us a cent, if they "make good" June 1, send the dollar.

You know we could not do business on such liberal terms if our seeds were not as represented. They are guaranteed true to name and the seed grown. Remember, we require no money in advance. Order today, using coupon below, and you will say it was one of the most profitable dollars you ever spent.

F. Gilman Taylor Seed Co.,
Box 27, Glendale, Cal.

Please send me prepaid one each of your vegetable flower collection. If they grow satisfactorily, I will pay you $1.00 on June 1st, 1906. If not satisfactory, it is understood that I am to be at no expense whatever.
[Write plainly.]

Looking for Educated Men.—Some time since, the Iowa Homestead published the statement that the University of Wisconsin each year receives scores of letters asking it to recommend suitable persons for such positions as editors of agricultural papers, assistants in the U. S. Department of Agriculture, professors, instructors and investigators in agricultural colleges and experiment stations, teachers of agriculture for secondary schools, colleges, and universities not distinctly agricultural, managers of stock and fruit farms, and country estates, experts in butter and cheese making for creameries and cheese factories, experts for city boards of health and dairy and food commissioners, and similar positions requiring accurate knowledge of the principles of agriculture and dairying. The demand for these men far exceeds the supply.

Commenting further along this line the Homestead says: "It is evident that the young man possessing energy and push, who really loves rural life, and will devote himself earnestly and conscientiously to the cause, can enter any department of agricultural effort with the feeling that he can attain as great success therein as in any other line, for no department of educational effort is today opening up more broadly and more rapidly than agriculture."

In accordance with the tendency of the times, which is one of specialization demanding that its successful men shall have thoroughly mastered some one thing, and be able to do that one thing as well as it can be done, advanced agriculture is dropping more and more into specialties. Instead of producing a little of many things, the successful farmer is now learning to grow a few products of great excellence. Many are demonstrating the fact that there is a profitable business in raising only one or two products, such, for example, as lettuce, carnations, berries, pure bred live stock, poultry, or pure bred seed grains. In order to do this most successfully, however, scientific knowledge as well as practical experience is demanded; a man must understand the basis of his work, as well as the best and most improved methods that are being developed in agricultural colleges and experiment stations.

What is true of the demand for trained men in agriculture from the University of Wisconsin, is true of the University of this State as well. The tendency is to go to the agricultural colleges, for help along higher farm training.

As a result of this tendency to make agriculture more scientific, there is an increasing demand for young men who have had a thorough training in this field. The value of accurate knowledge and special training in agriculture is being appreciated as never before. Capable, well equipped young men, whether with or without capital, are everywhere in demand in agricultural pursuits. As long as agriculture continues to be the greatest single vocation in the United States, with an annual output valued at over five billion dollars, there is an ample field for young men thoroughly trained. Many are needed, after their college course in agriculture, to go back to their own farms and operate them skillfully, with profit to themselves and the community about.

For the well trained young man, without capital, who must serve others for compensation for a time at least, there are ample opportunities in agricultural lines.

* * *

Storm Damages.—Reports from all sections of California indicate damage from recent storms. The fall of rain has been so continuous and so heavy as to tax to their utmost limit the natural and artificial conduits for water disposition. In some localities vast sections have been over flowed and consequent injury to ranchers has resulted. In many towns, water has worked desolation, destroying walks, drives, streets and parks. These towns, however, have no storm drain system, nor any means provided to discharge the excess water from the hills and highlands. This is where a great many California cities are deficient and it is where they should begin to make radical improvement. In towns skirting foot hills or mountains, the danger from wash and storm waters proves often most serious.

Drains and water ways are needed to control the torrents which sweep down the hills, and if these were provided thousands of dollars would annually be saved to individuals as well as towns.

The care of storm water is a most difficult proposition to solve, because so many questions of property rights arise, and the law is so complex in its applications, but for all that it must be solved and one of the first matters of importance for cities and rural towns to master is how to control the accumulation of water to the safety of property.

It has been suggested by government engineers that a dense growth of shrubbery planted on the hills and mountain sides would serve to retard the flow of water, while others recommended that this excess moisture should be conserved by means of conduits and ditches, into great cisterns for use in irrigation during the dry season.

It has been estimated that the foothills furnish enough excess moisture to irrigate thousands of acres of land and that a system of great reservoirs distributed along the foot of the mountains would furnish nearly all the irrigating water needed without the bringing of the Owens river into Southern California. The one system would cost about three millions of dollars; the other something like twenty-five millions.

* * *

Government Control of Railroads.—One of the latest converts to "socialism" is Andrew Carnegie. He has been advocating several measures in recent years, which smack of socialistic tendencies. Strictly speaking they are not in the propaganda of the conservative element of socialists, but they nevertheless lean to the co-operative idea.

In a recent letter to the Washington Post, Mr. Carnegie, expresses his views upon the pending rate bill and comes out squarely for government control of the national railways. He writes as follows:

"The trouble with the appeals to the courts is in the fact that railroad companies have their permanent legal staff. It matters little if appeals be frequently handed over, it will always retard and sometimes may defeat justice.

The great shippers who could afford to fight the appeals are those who benefit by secret rates or rebates. They are quiet, and wish no change. The small shippers must suffer, especially if appeals can always be taken. They can spare neither the time nor the money it would require to obtain justice.

The best remedy, as it appears to me, is to allow appeals only when a proposed change of rates effects the railroads to not less than $1 per annum. The amount should be what may be considered high by uninformed parties, but it is a trifling change which does not entail the loss to a rail oad company of a hundred or even two hundred thousand dollars per year. The commission should be trusted to decide trifling cases fairly, the railroad companies should be entitled to the judgment of the courts when their revenues are seriously impaired.

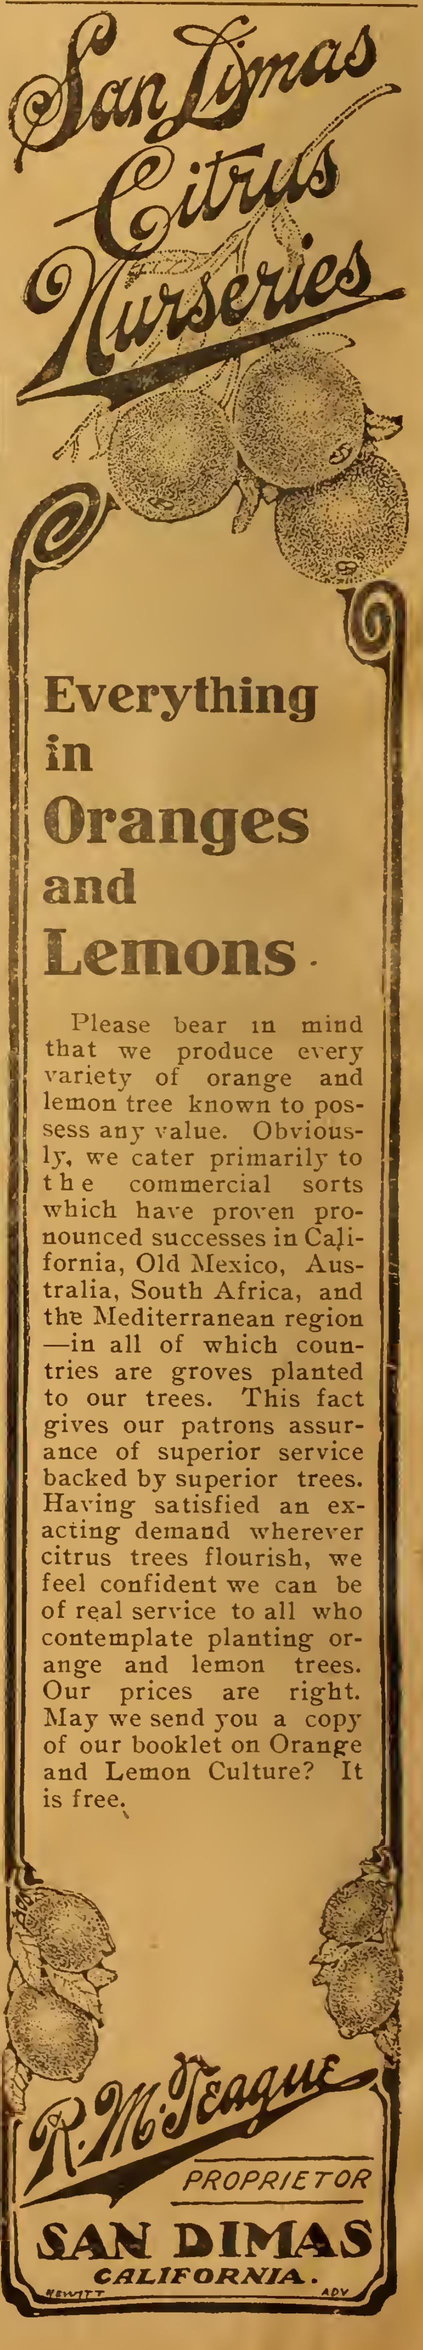
Government control of railroad rates I consider imperatively required. Other nations have found it so. So shall we."

* * *

Prof. Waite Gone.—Prof. M. B. Waite, who has had a large corps of expert assistants working on the pear blight in Central California, has finished his labors for the present season and returned to Washington.

On his return trip he made a pleasant call at the Cultivator office and expressed himself as well pleased with the results of this "campaign of education" as he terms it. It is believed that proper measures for the eradication of the pear blight have been taken in 90 per cent of the orchards and the Professor says that the near future will mark its almost total extinction.. tion.

California congressmen who have any regard for their political heads will give careful heed to the fruit growers' demands. Temporizing will not be tolerated.—Santa Ana Bulletin.



San Dimas Citrus Nurseries

Everything in Oranges and Lemons.

Please bear in mind that we produce every variety of orange and lemon tree known to possess any value. Obviously, we cater primarily to the commercial sorts which have proven pronounced successes in California, Old Mexico, Australia, South Africa, and the Mediterranean region—in all of which countries are groves planted to our trees. This fact gives our patrons assurance of superior service backed by superior trees. Having satisfied an exacting demand wherever citrus trees flourish, we feel confident we can be of real service to all who contemplate planting orange and lemon trees. Our prices are right. May we send you a copy of our booklet on Orange and Lemon Culture? It is free.

R. M. Teague
PROPRIETOR
SAN DIMAS
CALIFORNIA.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

Plans are matured for a large grape juice factory at Rochester.

The icing of orange shipments, en route for the Eastern markets has been commenced by the railroads.

F. K. Adams has received a choice bronze medal from St. Louis for a prize won by his plate pyramid exhibit of oranges sent to the Louisiana Purchase Exposition.

Monrovia and Duarte will receive large returns from oranges, the returns this season being twice as great as those last year. The Fruit Exchange declares a dividend of $15,000.

The "Big Four" ranch of North Rialto has been sold to three Colton men The reported consideration is $60,000. The property contains 213 acres, of which 160 acres is in citrus fruits.

Although there is report that some of the peaches have blighted, inquiry and examination of several orchards reveals the fact that there is a fair average of peaches set.—Hanford Sentinel.

The East Highland Orange Growers' Association is putting out three and four cars of oranges a day this week. The output of this house will be about 400 cars this season.—Messenger.

Butte county citrus growers will set out several thousand acres in oranges this spring. The people believe they can market this fruit annually from three to four weeks in advance of Southern California growers. The experiment will be watched with interest.

President W. H. Young of the Duarte-Monrovia Fruit Exchange has made reply to a criticism of C. N. Whitaker of Monrovia against the management of that organization. Young shows that the directors of the local body of the central exchange get $150 per year.

The Pomona Fruit Growers' Exchange sent a carload of oranges and decorations to the exposition. In the car were twenty-five different exhibits from individuals living in this valley. Of the number, many received prizes and Mr. Adams was among the number.—Pomona Progress.

The raisin growers of Tulare county will hold a meeting on the afternoon of March 31 for the purpose of accepting a plan devised by the executive committee of the company for a sweatbox pool of the raisin crop for the years 1906, 1907, and 1908, the hope being that a price of 3 1-2 cents may be realized clear through.

AGRICULTURE.

The cabbage crop of the Fullerton district will run 300 cars.

The first car of Green Top Celery was shipped from Smeltzer by the Golden West Company.—Huntington Beach News.

Shipments of celery from Huntington Beach for the week were seventy-two cars, which bring the season's total up to 2167.

The Thermal Cantaloupe Growers' Association has decided to make no contracts for the melons of the coming season. They will market their own production.

The Tulare Sugar Beet Company has three big plows, 32 head of stock, two seeders and several harrows all at work putting in the crop of beets on its land in the Browning tract near Tipton.—Register.

The United States Department of Agriculture will again co-operate with Sacramento Valley farmers this year in the experiments of Indian corn culture, and will also undertake co-operative experiments in forage varieties of sorghums.

The Carnegie Institute has decided to send a skilled botanist to Santa Rosa, California, to keep a careful watch of Luther Burbank's work and protect him as far as possible against further publication of absurd stories of his achievements, and to give out authorized statements whenever he has anything of public interest to announce.

One car of Pink Plume celery was shipped last Monday from the Orange county fields. J. C. Thomas raised this celery, which is a new variety. It is very crisp and tender and has a fine taste. It is hard to determine whether this celery is profitable, as it was planted very late, but a fair crop was harvested. This week will see the end of the shipment of Golden heart celery for this season.

LIVE STOCK.

Chino is to have a modern creamery.

Since its inauguration the Watsonville creamery has been a thriving and paying enterprise, says the Pajaronian.

A hog raiser near Stockton, fed 100 pigs on swill from the hotels and one third of the number died from hog cholera.

Articles of incorporation of the California-Mexico Cattle Company were filed at San Diego last week. The capital stock is $2,000,000.

Sufficient rain has fallen in California to insure a very large hay crop and stock will be abundantly supplied with grass late in the season.

A farmer in Yolo county sold a hog last week that weighed 332 lbs. at nine months and yet there are those who say California isn't a good hog country.

Serious trouble is brewing between the sheepmen of Oregon and Washington over a decision of forest reserve land located in Oregon, part of which has been set off to Washington.

The report of Secretary Trafton showed that, during the year ending March 1, 1906, the Watsonville creamery manufactured 206,824 pounds of butter. The amount paid out for cream was $44,987,85.

The Humane Society of Pasadena after depriving a dairyman named Bell of four horses which were so badly used up that it became necessary to shoot two of them, made arrangements to provide the man with other horses with which he can peddle his milk.

MISCELLANEOUS.

A new hotel and sanitarium is to be built in Elsinore.

The carnation fields at Oceanside are to be extended from five to twenty acres.

The Ocean Park City Trustees have let a contract for a $10,000 garbage incinerator.

The people of Tulare are beginning to take an interest in the proposition for a big May festival.

The street railroads of San Francisco, have agreed to lay their wires under ground, through part of the city.

A new train schedule has been arranged for Elsinore, which provides more acceptable service than the old arrangement.

After the city election at Riverside the citizens of that town will be asked to hold a mass meeting and frame a new city charter.

The present prospects for crops in Tulare county indicate that more of the farmers will be buying automobiles next fall.—Register.

Ground was broken last week for the erection of three new schoolhouses in the Santa Monica school district. They are to cost $75,000.

At Corona a new company has been formed, to incorporate with a capital stock of $25,000, for the purpose of manufacturing solar heaters and apiary supplies.

Business men and farmers from Colusa and Glenn counties are arranging a big excursion into San Joaquin Valley to ascertain the value of ditch irrigation.

The Board of Trade at Corona has received communications from a number of prominent United States Senators, announcing their support of the Hepburn rate bill.

The first machinery for a silk factory at San Diego has arrived. There are about 20,000 silk worms in the vicinity of the bay and more eggs are expected soon.—Escondido Times.

It is reported that the Fresno and Merced people who have suffered from high water intend to attach the money paid Rainmaker Hatfield, on the ground that he is responsible for their woes.

The Santa Clara County Promotion Committee is the name of a new organization, the object of which is to promote and advancement of all the Santa Clara Valley sections and towns.

The city of Sacramento owns its own water works. It costs the city $24,509 a year to run them; the city receives $125,000 income from them, leaving a profit of $100,000 in round numbers.

Secretary Bonaparte strongly recommended an increased appropriation for the Mare Island navy yard, to provide for the necessary equipment to build the collier Prometheus and other government boats.

The first conviction under the new child labor law was made in Los Angeles last week where a father was fined for keeping his 12 year old boy out of school to work in his shop. Let this law be enforced.

The oil district just north of the city of Bakersfield, Cal., known as the "Kern oil fields," has recently been surveyed by the United States Geological Survey, and as a result the Bakersfield Special map has now been engraved and printed.

Dr. Martin, formerly an inmate of the Mendocino State Hospital, has commenced suit against the county of San Francisco examining physicians; and the managers of the State hospital and demands as compensation for his illegal detention $9500.

The supervisors of San Diego have voted to spend $2000 this year on the coast road from San Diego north, and they are urging Orange county to appropriate an equal amount to be spent on the portion of the road within the limits of that county.

Pasadena property owner have been instructed by the city officials to tear out all culverts which interfere with the flow of storm waters in the gutters. Several thousand dollars worth of culverts are now being destroyed, and a new system of overbridging will be installed.

In obedience to orders received from the Department of Commerce and Labor, the local Federal steamship inspectors of the life-saving apparatus with which the ferry boats in San Francisco Bay are equipped, have installed new and improved life savers on all boats carrying passengers.

Bulletin No. 173 of the College of Agriculture, of the University of California, is most valuable. It is the report on Fertilizers for the year 1906. It gives the results of the analyses made of different fertilizers and their real price cost. This bulletin is free to all California farmers who write to Director Experiment Station, University of California, Berkeley, California.

Live Stock and the Dairy

BY MRS. MINNA E. SHERMAN, FRESNO, CAL.

AGAIN "MORE COW."

Now, I prefer every cow should go dry at least six weeks, but as I told you last week, I have not succeeded in this practice. I believe that I may read all the literature available on a subject, and yet, if I write from that I am failing, if I do not know that which I am writing to be true. That which is forced on us by experience. must stand. even if the facts do not fall in line with theories advanced from the study. It is well to say facts ought to do so. But if they do not, what are you going to do about it?

The best you can do is to try to solve difficulty without inflicting pain on the poor innocent cow. When you have solved, or failed to solve in something of this kind, it is well to tell others. so that they may follow your example or may steer clear of the experiment.

* * *

I do not, however. believe it right to use milk for human food close to calving time, however good it may seem to be, if it is good I have it given to the pigs, if not good, it goes into the manure pit with the liquids from the barns, and is hauled from there to the fields.

While I prefer that the cows should have a vacation of eight weeks, still I have her milked, rather than force her dry by limiting feed and producing a loss of condition. The cow really looses more than by feeding and milking and there is no caked udder or teat troubles to contend with. or the loss of butter fat while the cow is coming again to her normal condition. I admit it requires extra good cows to give these troubles, yet it is among the tops that the record breakers come out.

* * *

In judging of cows as to constitution, in the heifer, the very swayed back one as a rule are weaker than the straighter spine animals, in an old cow the back is naturally more swayed than in the young animal. The rigid back bone has a little greater elevation at the rump than at the shoulder. The hips and general back view may be coarser than in a cow. For the heifers that is too fine, as a heifer is often as weak as a cow. You know the Greeks understood this thoroughly in the human form divine, they chose for the models of Venus, boys of fifteen,,knowing that a godess should represent bodily vigor and force, and to that age form in the sex did not differ greatly, so it should be in the dairy. the form of a yearling, be it of either sex, should not be widely divergent. From this time on the heifer should grow more feminine, or cowy, and the male to his form or as a context would simply be more "bully."

Stamina is the hardest to build up at the same time milk production is increased. The will power of dairy cattle of good breeding is more like that of all well bred horses. they are responsive, while the common cows are ready to give up and die without trying to live. When they are sick they are like a mule that is bogged down. they will not do anything for themselves. One often feels that if they would only take a little interest they could get well.

I do not believe that a cow or horse ever forgets kindness. I had a neighbor call me over to his barn to see his cow ill with milk fever. We rigged up the Smitz air treatment and cured her. She was wild and half delirious when we began. I patted and talked to her coaxingly while we worked. The next morning she was up eating and was glad to see me, and though that was two years ago, she is always glad to see me. With the women of the family she is wild and threatens them with her horns when they come near. So well does she know me that she always follows me the length of her tether and shows pleasure when I pat her.

* * *

The Barnyard.—These faithful cows that work for us should not be required to stand in mud in the barnyard during the winter time. It is hard to keep the barn free from standing water, almost impossible at times, yet still we do not do nearly as well as we might with a little care.

The water from the eaves of the buildings is permitted to fall and make puddles around the buildings, this water should be piped away from the eaves in gutters to a place outside of the barnyard where it can run away into the field. The daily gathering up of the cow's droppings has a tendency to lower the barnyard. Now if we began by using a scraper to haul in earth, by taking this away from a broad drain made along the outside of the fence, two purposes will be served, a drain that will take the rain water that falls, out of the yard and to build up the barnyard so that it will shed the surplus water.

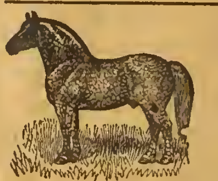
The yard should have a fresh surface all over it each spring. This is best hauled in rather than to plow up, for the surface is compact with the tramping and is a good foundation for the fresh earth. Where a baranca is near that is full of stones, a drain can be made by burying the round stones in a trench five feet deep and a couple of feet wide, using care not to get dirt in between the stones. I have seen wide drives made on top of these stone drains by using small stones and then crushed stone on top of that, making macadam, this drive was covered by cows, lying down close together, evidently they enjoyed its dryness. This drain or drive sloped away from the barn and only in the heaviest downfall did the water stand in the barnyard, and in a few hours it had found its way out to the drain.

In the San Joaquin valley we have stone and fortunately little rainfall. Sometimes a brush drain will act for a year or so. This is made with poplar poles, six or eight laid lengthways in a pile, in the trench, and then grapevine brush filled in, to within six inches of the top. This top is filled with the coarsest sand obtainable, usually from some neighboring ditch bank. In the upper part of the valley the water finds it easier to take to the sand than to penetrate the adobe. In our part of the country where the soil is readily absorbent, this form of drain has proven of little use. Just now the yards are distressingly muddy. If I were where the cobble stones could be obtained I should have the yard paved with them and then asphaltum put over them. Oiling the yard has been suggested but that should it become muddy would be terrible, for it could never be cleaned off the cows' udders in any reasonable time.

The stalls also need to be kept clean and well filled with dry earth. I am sure that plenty of dry sand on top of the pounded clay with a smaller amount of hay to make a better bed than so much hay, the sand is not hard like the unyielding clay and with enough bedding for comfort is better than too much, for it is usually foxtail hay purchased cheap that we use for bedding. Speaking of fox-tail reminds me of a little thing than happened last fall. It was in the middle of the fruit season and every room in the bunk house was filled, as well as all the tents. Two young fellows came in with the fruit packers that were supposed to room in town. One night they concluded that they would not go back to town and asked if they could sleep in the calf barn. Consent was given; in the morning they told the foreman it was all right, except that the cocktails bothered them. Some of the men thought a cocktail or two would not bother them and they guyed the fellows until they quit the job.

* * *

Editor Cultivator: I had a nice Jersey cow, five years old. When her calf was not more than twenty-four hours old she took sick. Her hind legs seemed stiff and her back weak, so she could hardly step. In six hours time



The San Fernando Valley Horse Breeders Association will stand the Imported Prize Winning Clydesdale Stallion **Barometer** for the season of 1906, commencing March 15th. At Toluca, stables of A. McCormick, Thursday, Friday, Saturday and Monday. At Burbank, at Tom Stony's barn, Tuesday and Wednesday. Service for the season, $17.50. Insurance under special agreement. Best care given stock, but accidents and escapes are at owner's risk.

Barometer was shown at Glascow, Scotland, with his sire, who took first premium, and Barometer second. Barometer took first prize at the Ohio State Fair, 1905: first prize at American Royal Fine Stock Show, Kansas City, Mo., 1905. He is mahogany bay, weighs 1900 pounds, five years old, fine action and carriage, and a perfect horse in every respect.

Pedigree **Barometer** (11254) 11802, mahogany bay, foaled June 20th, 1900, bred by James Fleming, Friock Mains, Friockheim, Forfarshire, Scotland; sired by Benedict, 10315, dam Bell of Friock Mains, 14212, by Laird Darnley, 3748, 2nd dam Polly, 4876, by Lord Lyon 489; 3rd dam Young Mary, 519, by Prince Charlie, 629; 4th dam Mary of Drumflower, 112, by Lochfergus Champion, 449. Benedict, 10315, sire of Barometer, by Barons Pride, 9122, out of Mary MacGregor, 12864, by MacGregor, 1487, he by Darnley, 222, etc., out of Sally, 60, by Prince Charlie, 629, etc. **A. J. 100% on Your Money Every Year for Twenty Years

This is the marvelously good investment that more than 700,000 users have actually found the DE LAVAL CREAM SEPARATOR to be.

With the average number of cows a DE LAVAL machine saves and earns its whole cost the first year, which it continues to do yearly for its established life of fully twenty years more to come.

There surely isn't another such investment, either on the farm or off it, open to anyone having cream to separate. Why delay making it?

As for the first cost, if you have the ready cash of course there is a fair discount for it, but if not any reputable buyer may secure a DE LAVAL machine on such liberal terms that the machine is actually free of cost, for it will earn its cost and more while you are paying for it.

she was unable to get up and only lived one night and half the day. She seemed to have no fever and her bag was perfectly cool and not caked at all. There was no passage of dung or urine although I gave her one pound of salts. Please answer through the Cultivator as to what the disease was. —H. F. B., Modesto.

A familiar type of milk fever, and the most fatal before we knew how to treat it. The cow's udder should have been injected with air. Where one has not the regular outfit for this it can be done in the following simple way: borrow a bicycle pump, then a piece of rubber hose, using on the end of it a medicine dropper if you have not a milking tube. Grease the milking tube or its substitute after having dipped it into hot water, then slip it into the cow's teat with the rubber hose attached to the other end of it. Pump the air slowly into the teat until that quarter of the udder will hold no more, then slip out the tube and slip a rubber band around the teat, a visiting card underneath will keep it from cutting too deeply as it must be firm enough to hold the air in the udder, repeat this with every teat. The next cow that you have freshen, this trouble can be avoided by not milking her clean at once, but by leaving for the first forty-eight hours enough milk to prevent the collapsed condition, take as much as the calf will drink and no more.

H. N. WILLIAMS COMPTON, CAL.

Editor Cultivator: Would you kindly tell me what to do for my cow. She has a cough and makes a wheezing sound in her throat. She is fat; gives seven quarts of milk a day and eats well and looks well.—Subscriber, Otay.

Colds in cows are to be watched carefully as they run readily into consumption. Simple colds in the head are common and they produce a noise in breathing. If in the head inject warmed olive oil to relieve dryness, and make a bran mash and tie it under the cows nose steaming hot, so she will breathe in the steam.

If there is fever present and the cold can be located in the throat, apply a mustard poultice to the throat and then tie it up to keep it warm. If there is fever the old Youatt remedy is good, this is in powders, made as follows:

Powdered digitalis 1-2 drahm; powdered ipecac 1 drahm; nitrate of potash 2 drahms; sulphur 2 drahms. Give at one dose in a quart of gruel, morning and evening until not needed, after the fever has passed, or if there is no fever, the following is useful: guaiacum 2 oz.; sasafras 1 oz.; half a stick of licorice. Boil in a quart of water until reduced to a pint, strain and give half at night and half the next morning.

CARE OF THE FLOCK

The American Shepherds Bulletin very timely says, "It is impossible to lavish too much care and attention on a flock of breeding ewes and these animals will respond to good care and good feed more quickly, perhaps, than any other animals. While sheep seem to like dry cold, or at least are well prepared to stand it, they cannot endure cold, rainy weather without suffering. They need plenty of exercise however, and should, if possible, be fed outside, sheds being provided for them during inclement weather. As to feed, let the ewes have plenty of it and at regular intervals. Change of food is also very important. For roughage, clover hay. corn. fodder and oat straw are the best. Of these, clover hay is the most nutritive, oat straw being next in value. Corn, oats and bran are the best concentrated feeds. About half a pound of a mixture of these should be used daily in connection with the roughage. Corn being the most nutritive of these, a smaller quantity will suffice in the mixture. A supply of salt and clean water should always be within reach of the animals. About breeding time it is absolutely necessary to have the ewes in good condition. Keep the ewes clean, that is, keep their surroundings clean and their sheds well disinfected.

SHEEP AS A COMMERCIAL PROPOSITION

Three years ago a Wisconsin man purchased on the Chicago market a band of eighty ewes at a cost of $240. A few days since he disposed of them, not one having died meanwhile, for $340. Although old and in his judgment past the age of breeding usefulness, another farmer secured them with the object of founding a flock.

The Wisconsin man, while a good sheep handler, did not keep books, consequently his revenue from that small band of ewes cannot be given with any degree of accuracy. During the three years they were on his farm however, he sold lambs to the value of about $500 annually, although to do this it was necessary to keep them until midwinter. This money he regarded as clear profit, charging up the value of the wool against the cost of maintaining the ewes, and raising the lambs. In other words, a band of eighty ewes paid a return of 200 per cent annually on the original investment. These figures appear alluring and the fact must not be overlooked that a band of ewes of this size with their progeny are a constant care on the farm, this being one reason why the native crop is as meager as it is.—Breeders' Gazette.

After reading the various articles recently appearing in regard to a machine for milking cows, and the benefit derived therefrom a young genius of Clinton, Iowa, has conceived the idea of doing away with the cows entirely and arriving directly at the desired end. He says he has a machine nearly perfected into which he can feed the grain, ensilage or other feed usually given the cattle and by a secret process extract the butter fats direct. thereby saving the cost of milking, separating the cream, etc. He also asserts that by a slight change in the mechanism. but by the same process. he can produce condensed milk, sour milk, whipped cream and various other products. The inventor as yet is not ready to submit his machine to the Farmers' Club for their inspection, as some of the minor detail is not complete, but he is very confident that in the near future his invention will revolutionize the whole present system of dairying and incidentally lower the prices of beef by flooding the market with cows. Possibly. however, the beef trust will buy him off for the sake of holding the market at its present figure.

Large lambs make gains faster than small ones and ewe lambs fatten as readily as wethers.

BY MRS. A. BASLEY, HOLLYWOOD, CAL.

SOME TRIALS OF CHICK RAISERS.

I had intended writing about the chicken parasites, lice, mites, fleas, and ticks as some of my friends are writing me that they are having trouble with their young chickens, although from what they tell me I think it may come from wrong feeding as well. Of course you all know the three requisites for egg production—Comfort, exercise, proper food. These three are also necessary for the successful raising of chicks whether in a brooder or under a hen.

Comfort, cleanliness, warmth, sunshine and shade, scratching and running and playing, for the baby chicks have their little games. and little fights too—and then the proper food. Now about cleanliness with little chicks, each time a brooder full of chicks is moved out, that brooder should be well washed and scrubbed with scalding suds. I do not believe in putting strong lice-killers, or distillate, or even pure coal oil into brooders, the smell or fumes are too strong and disagree with and sometimes kill the chicks. A friend of mine lent a brooder to a neighbor and on its return found mites in it, she immediately painted it liberally with liquid lice-killer and then sunned it for a week, leaving it wide open all the time, at the end of the week she put her week old baby chicks into it; the next morning several were dead, and every morning she found some dead. I happened to be there and suggested that it all came from the odor of the lice-killer. She moved the chicks and thoroughly washed, scalded and aired it in the sun and had no further trouble. Few people realize what a great cleanser scalding hot soap suds may be. The boiler of good, strong wash suds is emptied out, whereas if put on a fire again for a few minutes and then thrown into the corners of a hennery, it would kill many a breed of young fleas, or used upon a brooder would destroy mites and their almost invisible eggs, besides microbes of tuberculosis, chickenpox and other diseases of infant chicks.

* * *

What to do for head lice on the baby chicks is another conundrum in this week's mail. Every magazine says "grease their heads." I do not I much prefer liberal doses of "buhach" well rubbed in. Buhach is the center of a daisy called Pyrethrum cineraraefolium which grows abundant in Dalmatia, the peasants there making a good living by gathering it. Therefore, in Europe it is called Dalmatian powder. It is also called "Pyrethrum" in the East, but the best and strongest is grown in California. It is as harmless as a daisy to animals or chickens but it contains an essential oil which asphyxiates all insects. It will kill all lice, fleas and even the common house fly. In the course of my travels in Africa I saw an Arab come out of a house with his bare legs so covered with fleas that it looked as if he were wearing boots.

In another place I was warned, "do not enter that room, it swarms with fleas." A pound of that excellent powder was scattered over the floor and not one flea survived and the room was quite habitable and used afterwards for years.

At another time I was staying with a friend in New York State, her kitchen had been painted, and it seemed as if all the flies in the village congregated there. I had some buhach and a little powder gun. I closed tightly every door and window and blew bubach into the air till it was like a cloud of dust. Then came out and looked in through the window, the flies flew around as if drunk, and finally they and the buhach feel to the floor where they crawled around stupified, and before they could recover, whilst they were still asleep, we swept them up and put them into the kitchen fire. Not one fly was left.

* * *

After my various experiences with this powder, I decided to try it on chicken lice, and found it comes up to my expectations; it will kill any and all lice and is perfectly harmless to chickens, and also to turkeys. It will kill fleas on cats and dogs, and mites on canaries.

There is only one drawback, and that is, that the deadly essential oil in it evaporates quickly. it must be fresh or it is valueless. and it should be kept for this reason in a tin box. tightly covered. Also as it is expensive. it is frequently adulterated.

Next to buhach, Lambert's Death to Lice is the best insectide I know of. It is composed principally of tobacco dust. Some of the insect powders contain carbolic acid. or napthaline. in such strong quantities that although they may kill the vermin, they prove very injurious to little chicks.

A sucessful poultry breeder, a friend of mine, had a young lady staying with her to help her and also learn the poultry business. She gave the girl the brooder house to attend to, directing her as to the cleaning, feeding, scalding water vessels; keeping sweet milk, and chick feed always there, etc. My friend was a very busy woman, and had her own routine of work, but one day she discovered the girl had allowed lice to invade the brooders. Then there was trouble.

Petaluma Incubators and Brooders
The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the **GOLD MEDAL** at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?
St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A Filcher, Commissioner.
And Now Comes New Reward for Merit:

McClanahan Co., Los Angeles, Cal.

The girl had read that lard and kerosene put on the heads and necks would kill lice and she declared that the insect powder had no effect whatever, so contrary to my friend's wishes, she prepared some lard and kerosene and one day when I happened to visit that ranch I found her seated on the ground in one of the runs. with a can of lard and a swab of rag and she was catching each chick. anointing it liberally on its head and neck; some went into its eyes; so it proceeded to use its wings as a pocket handkerchief. Poor little things! I really think that greasing injured them more than the lice would have done. My friend wrote "Miss ——— has left; fighting lice was too hard work; her greasing did not exterminate them; what shall I do?"

I replied that she had better take a bowl of good hot soap suds; put in thirty drops of carbolic acid; take an old tooth brush and on a sunny morning brush the little heads. I thought about three applications at intervals of three days would eradicate the lice. She did so and found it excellent but used buhach on the turkeys.

Next week I will talk on feeding little chicks the balanced ration of 1-3 and why.

A MAMMOTH POULTRY PLANT.

The fame of Petaluma's large chicken industry has spread far and wide, and it is generally known that this is the home of the prolific hen and noisy rooster. It has been the pleasure of the writer to make several trips about that community and observe the vast number of industrious White Leghorns which are daily adding to wealth. It is estimated that the output of poultry and eggs from this community brings back to it in good yellow gold practically $2,000,000.

Some of the ranches cover anywhere up to one thousand acres. But at the same time some of the most successful and profitable plants, close in town, are conducted on very little space. One of these, which may well be called a model as to its economic handling is the mammoth poultry plant of the Must Hatch Incubator Co., although it occupies only two acres on which are hundreds of profitable birds as well as the manufacturing plant of the incubator factory.

Mr. A. E. Bourke at the head of this concern has spent several years of hard work in bringing this successful house to its present magnitude. We give on this page an illustration which will convey an idea of its size and management. Considering that Mr. Bourke went to Petaluma with only two horses, a wagon and a capital of practically ten dollars, it is remarkable to note the success he has achieved.

The plant consists of a large incubator house twenty-four feet wide and one-hundred and sixty feet long, filled with Must Hatch Incubators. In this room there is a combined length of 320 feet of incubators, with a total capacity of 50,000 chicks per month. Between these rows of incubators is a track extending the entire length of the building, on which is run a car or table especially constructed for the conveyance of eggs and chicks to and from the incubators and also for turning the eggs on the trays, an operation which has to be gone through twice a day.

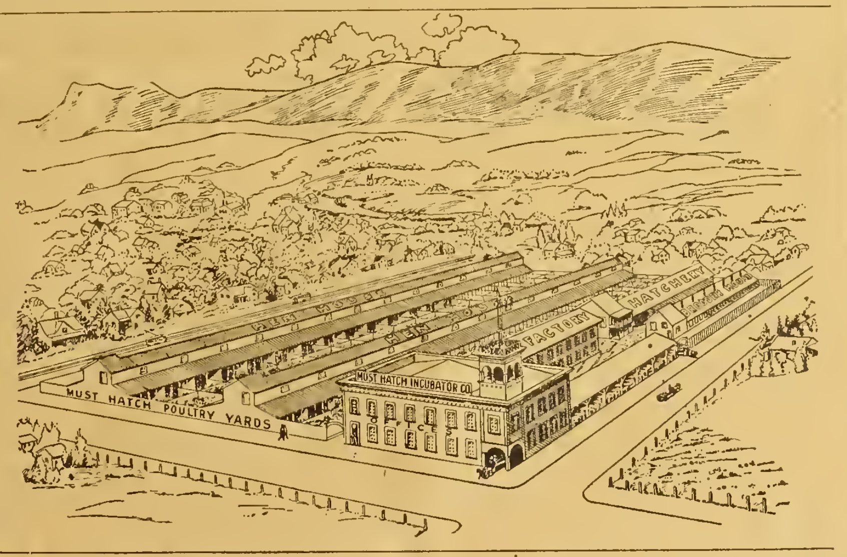
The most remarkable portion of the poultry plant is the alley way between the hen houses, and its arrangement for economic feeding and gathering of eggs, and care of the poultry. The entire upper story of this immense building is used for the storage of feed and so perfect is its arrangement that dry feed for every pen is always at hand, thus making it an easy task for one to look after 1700 hens.

A neatly arranged little car is used for conveying the mashed food and the collection of droppings from the roosts making it an easy task for one man to care for this house. On either side of the aisles are constructed two concrete mash feed troughs, with running water at hand for keeping them and in fact the entire house scrupulously clean. The floors of all the pens are also of concrete which facilitates the changing of the scratching litter which is always kept pure and clean, thus insuring the hens against disease, lice, etc.

Mr. Bourke says that the plant averaged last year a total of 425,000 chicks.

The factory for the construction of the Must Hatch Incubators has the same features of economizing work as have the poultry and incubator houses, which accounts for the large number of these successful machines that are being put out every year.

The C. H. Lilly Co., are this year pressing the sale of these incubators which are largely sold not only in California, but in the entire northwest.



No Results No Pay

WE have spent a vast amount of money experimenting with Poultry Feeds—compounding, grinding and mixing different grains with seeds, alfalfa and meat in hundreds of combinations. Then feeding it and watching what happened.

The result of this time and money is

Purina Poultry Feeds

They will cause a hen to lay all the eggs she should, day after day, year after year, winter and summer, and will keep her healthy and vigorous every minute.

And they will do it every time—not just once in a while.

But don't take our word for it—try the Purina Feeds on your hens at our expense.

If the results don't come, just tie up the bag and write us and we'll return every penny of your money and tell you where to send the balance. You are not out a cent in making the trial, for we will deliver through your dealer or direct, FREIGHT PAID, and the feed used in testing will cost you nothing.

Ask for particulars about our FREE TEST Plan. Write today—you can't afford to wait.

PRACTICAL INCUBATORS positively the best. Hatches more and stronger chicks. 10 YEARS' GUARANTEE

Cat. free. PRACTICAL INC. CO., 720 S. 11th St. San Jose, Cal.

Why do you pay $5.00 to $8.00 per hundred for eggs for hatching when you can get just as good eggs from just as good stock from us at one half that price? Our stock is large and healthy. The hens lay lots of large white eggs that run as high as 98% fertility. We sell eggs in incubator lots only at $2.50 per hundred.

Avenue Poultry Yards, Ventura, Cal.

EVILS OF CROSSING BREEDS OF FOWLS.

The evils of crossing are many. None is more certain than its influence over size, shape and color of the eggs, both externally and internally. A mixture of breeds makes a change in the shape of the egg and the color of the shell. The size, shape and color of eggs affect their value. as the same qualities affect the value of fruit, why not have at least some consideration for the improvement of eggs?

When selling time comes, the fine-shaped, clear-colored, smooth-shelled eggs bring the best prices, as does the well-rounded, even-shaped dressed poultry of attractive color; while over-fat, ill-shaped, off-color carcasses are a drag on the market. The product of badly selected crosses may be ill favored through unattractive color, the result of a cross of yellow-skinned fowls with those having the clear, pinkish-white shade. If you mix yellow paint with pinkish-white, you lose the attractiveness of both.

To grade our flocks from the common to the better kinds is possible provided you stick to the one kind of standard-bred males in your flock, have all the males of one kind and continue from year to year the use of the same kind only. Never change from this breed of males, and do not use any of the half or part-bred males as breeders. Supply yourself each year with a new, fresh line of males for the next year, from eggs secured from well-bred stock.—County Gentleman.

HOW TO TELL GOOD LAYERS.

To learn how to tell the best layers of one's flock comes only from experience and close daily contact with the fowls. One can hardly tell another how to pick out the best layers. The attention can only be directed to certain features of the business, which will serve as guides in the matter of making such selection. It is only one of the many details of the business that have to be closely studied in order to master it, even to a fair degree of certainty. The lesson is not so difficult to learn as one might suppose, only requiring close observation and ractice. The only way to select the best layers is by elimination, first selecting the lazy birds—the drones. They are generally the last birds off the roost in the morning and the first birds on the roost at night. They may generally be found during the day handy to the feeding place or loafing in some sheltered nook. They generally have a colorless comb and are fat and of poor form. On the contrary, the layer is off the roost singing and cackling at daybreak, and often before, and when not on the nest will be found rustling and working, either scratching in the litter for the hidden grains or roaming over the pasture and plowed ground in search of green stuff and worms. She has a red comb, a firm characteristic of her breed, a lively and happy disposition, and carries with her an air of importance and usefulness. She shows an interest in her work and an ambition to pay for her keep and more, too She shows a love for the caretaker and evidently likes to be noticed.—H. L. Blanchard.

One is not likely to get rich suddenly in poultry business, but one can meet a lot of good fellows among poulrtymen and make a living easier than in any other business.

LAYING HENS

We have a few choice 1½-year-old Thoroughbred White Leghorn hens, which we are offering at a sacrifice. In order to make room for our young stock we are offering these fowls at $15.00 for 12 hens and 1 rooster or $100 per 100.

We also have a number of 5-months-old pullets, also of the same variety, on which we can name you the same price. If your stock needs renewing, send in your order at once, as they are going fast.

We have a Hatchery of 50,000 chicks per month capacity, from which we are making shipments daily to all parts of the Coast. If you need any just hatched chicks have your order booked at once, so as to get them on the date desired. Our price for just hatched chicks is $7.50 per hundred f. o. b. Petaluma.

We manufacture the famous MUST HATCH INCUBATORS AND BROODERS and a complete line of poultry supplies of every description. We cater to the best hatching egg trade on the Coast.

Before purchasing write for our new illustrated Catalogue B, which contains descriptions, prices, etc., of all our goods.

Must Hatch Incubator Co., Petaluma, Cal.

SETTING HENS.

A writer in the seventeenth century gives interesting directions on how to set a hen. Among other things he says:

The best time to set hens. to have the best, largest and most kindly chickens, is in February, in the increase of the moon so that she may hatch or disclose her chickens in the increase of the next moon. It is held a brood of March chickens is worth three broods of any other; you may set hens from March till October, and have good chickens. but not after by any means, for the winter is a great enemy to their breeding.

"A hen doth sit twenty-one daies, just, and then hatcheth, but peahens, turkies, geese, ducks and other waterfoule sit thirty; so that if you set your hen, as you may doe upon any of their eggs, you set her upon them nine daies before you set her upon her owne.

"A hen will cover nineteen eggs well, and that is the most in true rule she should cover but upon what number soever you set her, let it be odde, for so the eggs will lie round, close, and in even proportion together.

"It is good when you lay your eggs first under your hens, to marke the upper side of them, and then so watch the hen, to see if she busie herselfe to turn them from one side to the other, which if you find one doth not then when she riseth from her eggs to feed or bathe herself, you must supply that office, and turn every egg yourselfe.—Poultry.

EGGS AS FOOD.

Eggs without doubt stand next to milk in available food material for the sick, as they are easily digested and absorbed if raw or properly prepared. Physiological chemists tell us that 97 per cent of the albumen and 94 per cent. of the fat are absorbed into the blood stream. These same chemists tell us that eggs are a complete food for young mammals, as they contain in correct proportion, the tissue-building material, in form of albumen (white) and mineral matter, in the form of phosphorus, lime, potassium, iron and sulphur; the heat and energy material in form of oil (fat) in the yolk and a large amount of pure water.

Owing to the lack of starch and sugar an egg cannot be called a complete food for the adult; hence bread, rice or some starchy food must be served with eggs. To render the food complete, the sick must be fed as children are—that is, with foods that are easily and quickly digested and absorbed, for the digestive organs are always weak. Eggs, therefore, are among the most valuable of foods for this purpose.—Southern Poultry Courier.

PREVENTION OF POULTRY DISEASES.

Among poultrymen the idea is steadily gaining ground that success in doctoring fowls for disease is a very serious misfortune, because it prompts the poultryman to adopt a wrong basis and a bad footing to work upon. Having once succeeded he acquires the habit of fussing and drugging with the inevitable result that the birds contract the habit of getting sick. In general, the measure of success in this direction will be the exact measure of misfortune; for it means increased number of sick fowls. On the other hand, leading poultrymen everywhere agree with the prominent physicians that prevention is the one universal, practical basis. They therefore strive to keep their birds in perfect health by every reasonable and practical precaution with respect to sanitation, ventilation, exercise, light, shade, food, water, etc., and to management in general. They reason that healthy hens are happy hens and only such are profitable to keep.—Orange Judd Farmer.

White Wyandotte Eggs
For hatching. Pure Dustin & Hallack strain. From 1st Pen, $3.50 per setting, 2nd pen, $2.50.
Mrs. S. H. Church, 505 S. Main St., Los Angeles

White Plymouth Rocks
Standard Bred. Eggs for hatching, 10c each. Incubator lots, $7.00 per hundred.
C. M. Johnson, Gardena, Cal.
Yards at Strawberry Park, on electric lines.

For Sale—Eggs for Hatching
R. I. Reds and S. C. White Leghorns. Reds are imported stock. Leghorns are Howard strain. Pair of fine Orpingtons and cockerels for sale. ***M. J. R. Cutting, Monrovia, Cal.***

Single Comb Brown Leghorns
Exclusively
Stock for sale and eggs for hatching. Eggs from first pen $2.00 per 15 eggs, second pen $1.50 per 15. Incubator lots for $6.00 per 100 eggs. They have always won first prize whenever shown. Large birds and heavy layers.
W. E. Mercer - - Ventura, Cal.

A POULTRY COLONY
NEAR LOS ANGELES
Is at present being formed for the purpose of mutual benefit. Situation unexcelled; plenty of good water, splendid soil and close to town. For particulars apply to
Anna L. Pinkerton
Realty Trust Company, 129 So. Broadway, Los Angeles, Cal.

Fairview Poultry Yards
SILVER LACED WYANDOTTES
Two pens, both headed by prize-winning cockerels; 1st at Los Angeles and 1st at San Diego. Four prize-winning females in pens. Eggs, $1.50 per 15.
WHITE PLYMOUTH ROCKS
Special mating, pen headed by Fairview Prince, a son of the best layer in our yards, $1.50 per 15. Five pens large MATURE hens mated to vigorous Cockerels, $1 per 15 eggs; $5 per 100. Eggs from these pens specially recommended for incubator hatching.
A. E. NELSON, EL MONTE, CAL.

Golden Crest Poultry Yards
White Leghorns—Eggs, 50c per setting, from pens of Petaluma's best laying strain. $3.00 per 100.
Barred Rocks—75c per setting.
Prize winning **White Crested Black Polish** my specialty.

Veterinary

BY DR. W. J. OLIVER,
318 East Second St., Los Angeles

To the end that this department may be made as valuable to the subscribers as possible, we ask observance of the following: Be sure to state in full the history of the case, location of the disease and the conditions under which the animal has been kept just before and since the disease appeared. Give your name and address, which will not appear in the paper if you so request. No charge whatever is made for such questions as are answered through the colums of the Cultivator, but when an immediate mail answer is wished Dr. Oliver asks an additional fee of $1.00 and will give immediate attention and reply by mail. In such case write Dr. W. J. Oliver, 318 E. Second St., Los Angeles, Cal.

Questions should be in by Monday to be answered in the following Friday's paper.

MANGE.

Editor Cultivator: Will you please answer following in Cultivator? What is good to put on dogs that seem to be troubled with itch. They have no fleas, but are constantly scratching until they make sores?—S. H. C., Duarte.

Your dog has mange. Wash the dog with Kreso Dip about one to fifty of water; repeat twice a week.

* * *

Editor Cultivator: Will you kindly tell me what to do to a dog that is scratching herself awfully, especially lately she is pulling all the hair down and the skin is getting sore. No lice, no fleas and nothing at all on her; seems to me rather a skin disease?—P. A. T., Fowler.

Your question is answered in another item this week.

Climate and Crops

General Summary.—The weather stormy and unsettled throughout the entire week in all parts of Californit. Heavy rains fell day after day and the warm weather in the mountains has caused dangerouously high water in many parts of the State. The rains of the preceding week had filled all reservoirs and streams were running nearly bank full. The great volume of water added by the storms of the present week will result in overflows in many parts of the State.

Sacramento Valley.—Heavy rain continued throughout the week. Southerly winds prevailed from Tuesday until Sunday. On Friday the wind reached a velocity of 36 miles per hour A thunderstorm is reported at the close of the week. Warm weather in the mountains caused a rapid melting of the snow which, added to the heavy rains, resulted in high water and freshets. The snowfall in the mountains is heavier than it has been for years. The week closes with showery conditions continuing and every likelihood that large areas will be overflowed. The lowest temperature was 44 degrees on Tuesday and the highest 64 degrees on Thursday.

Coast and Bay Sections.—Continuous rains prevailed throughout the week with moderate southerly winds increasing to moderate gales on Thursday. The rainfall was exceptionally heavy for this period of the year. On Friday over an inch of rail fell in less than 24 hours. The temperature was too high for any snowfall in the coast range.

San Joaquin Valley.—Cloudy weather prevailed throughout the week with rain on four days. All of the tributaries of the San Joaquin are running bank full and considerable damage has been done in places by the high waters. In the vicinity of Sonora county, bridges, railway trestles and roads have been washed away. In many parts of the valley creeks and rivers are out of their banks. Breaks in the ditches and canals are numerous. At San Joaquin bridge a river stage of 18.5 feet occurred on Sunday night. This is the highest water recorded at this point.

Southern California.—Stormy weather prevailed throughout the week, with heavy rains on Wednesday, Thursday, Friday and Saturday. High winds were reported on Saturday; and at San Diego a maximum wind velocity of 28 miles per hour from the south occurred. Thunderstorms were reported at San Luis Obispo Saturday afternoon. The rainfall during the latter part of the week was very heavy in all portions of the south. At San Diego up to the close of the week the seasonal rainfall was nearly two inches in excess of the normal. As shown in the table of seasonal rainfalls the water supply is abundant. The week closes with unsettled weather and showers still prevailing.

SILK-GROWING IN CALIFORNIA

Continued from first page.)

California has an advantage over all other countries in silk raising, because of her fertile soil, and her mild climate, where no rain or electric storms come during the long summer months.

Will silk raising pay? is a question that I have been subjected to. It will pay better than any other industry, depending upon how familiar we are with the industry, and will pay still better when we can supply our own market.

Previous experiments with silk raising have been tried in several places, thirty or forty years ago, when the gold fever was too strong for any one to bow down to feed silk worms as an industry. About that time the State passed a law giving a bounty to foster the planting of mulberry trees and speculators planted thousands of worthless trees. The bounty was withdrawn, as at that time silk was not in demand as it is today. We must have patience as there is no product which pays a big dividend to begin with, but it will richly reward us in the future for our efforts expended in pioneer days.

MULBERRIES FOR SILK CULTURE.

As the silk worm industry is progressing there are calls for the leaves of the mulberry on which to feed the worms. The mulberry used is the common white, Morus alba, but no doubt the Russian and Japonica are as good for the purpose, as both are supposedly but varieties of Morus alba. Continual picking of the leaves weakens trees greatly, hence the desirability of having two sets, one set to be allowed to grow at will every other year. And if some time before spring the bushes were severely pruned the young shoots which would follow would give large, luxuriant leaves.

Mulberry seedlings are best raised when seeds are sown very soon after they ripen. They should be washed free of pulp and sown in the Fall. But if kept from becoming too dry through the winter they may be sown in early spring and fair success will follow.

Osage orange belongs to the same natural order as the mulberry and can have its leaves fed to silk worms, but the silk is reported not as good as from the results of mulberry feedings. The paper mulberry and the fig are in the same order of trees as the common mulberry.

Water the horse reguarly, either before feeding, or an hour after.

THE YEAST TREATMENT.

Again inquiries come for the republication of the yeast treatment for barrenness, which we have printed several times. It is as follows:

Take an ordinary two-cent cake of yeast and make it into a paste with a little warm water. Allow this to remain in a moderately warm place for 12 hours, then add one pint of lukewarm, freshly boiled water, mix and allow to stand for another 12 hours. Prepare this mixture 24 hours ahead of the time the cow is expected to come in heat and inject it into her vagina the moment she is seen to be in heat. Breed her just when she is going out of heat.

The comment of our veterinary editor on the foregoing was as follows:

"The theory upon which the use of this mixture is based is that the usual cause of barrenness is bacteria of some sort or another and that they give rise to an acid condition of the secretions of the generative organs which is destructive to the female ova and male spermatozoa. The yeast fungi (Saccharomyces) when introduced as suggested are supposed to invade every part of the cow's generative organs, destroy all bacterial life and incidentally neutralize the acid condition referred to. We understand that to Dr. Peters of the Nebraska Experiment Station belongs the credit of having discovered the first intimation of this method of treatment in a French medical book or journal. It is to be hoped that it will prove a success and readers are requested to give it a thorough trial and report results."

Recently in reply to inquiries Dr. Alexander has stated that the fluid yeast ordinarily kept in the household will answer instead of the yeast cake, using about the same amount as is required for an ordinary baking. He invites reports of results obtained by this treatment, which is in its experimental stage.—Breeders' Gazette.

A table compiled by the State Department of Highways shows that the annual tax rate for road purposes levied by the Supervisors of the different counties varies from 24 cents on $100, in Kern and Mono counties, to 60 cents in San Diego and Los Angeles, the most common rates being 35 and 40 cents. The amount to be raised for road purposes in the State for the fiscal year ending June 30th aggregated $2.540.019. This is in addition to all expenditures by the State itself for the support of the Department of Highways and the construction of "State Roads." The largest amount raised by any one county is $281,790 by Los Angeles county, and the smallest $5664. by Inyo county.

IT'S PENNY WISE

Policy to set out a good tree, costing good money and then let the sun burn the bark, or the rabbits gnaw it when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Mfg. Co., 2124 Willow St., Los Angeles.

217-220 Conservative Ins. Bldg. Los Angeles, Cal.

AUCTION

75 Cows and Heifers, 4 Horses, 2 Mules, 40 Hogs

Thursday, April 5

At 10 A. M.

On Gwynn Ranch, 2 Miles West of Foot of
CAHUENGA PASS
On Ventura County Road, 5 Miles Northwest of Hollywood, in San Fernando Valley.

25 Head of good Milk Cows, mostly Jerseys, fresh and coming fresh, in good condition, rich milkers.

10 Head Steers coming 2 years old.

25 Head 2-year old Heifers, Durham-Jerseys, coming fresh. 20 Head Yearling Heifers, Durham-Jerseys. 1 Fine Durham Bull.

2 Work Horses, 2 Work Mules, 1 2-year-old Iron Gray Draft Colt. 1 3-year-old Iron Gray Mare Colt.

40 Head Brood Sows and Shoats in Fine Condition.

50 Tons Oat and Barley Hay, baled, Farm Implements, etc. I am absolutely quitting the dairy business and everything will positively be sold to the highest bidder without reserve.

TERMS—9 months time will be given with note and approved security. Liberal discount for cash. FREE LUNCH AT NOON.

A. J. Gwynn, Owner

Rhoades, Reed & Rhoades, Aucrs.
Office, 730 So. Spring St., Los Angeles.

SAVE ALL YOUR CREAM

A hired man who doesn't milk your cows dry every milking is pretty poor dairy help at **any price.** Isn't that so? And in the same way a cream separator that leaves part of the cream in the milk every skimming is expensive, no matter what you pay for it. The improved

U. S. CREAM SEPARATOR

Holder of World's Record for clean skimming

takes out more cream than any other separator. This is due to the exclusive construction of its skimming device. We want to show you about this, and prove that what we say is true. The best way to do it is to have you see one of our big, handsome free catalogues. Just write us a postal and we'll send you one by return mail. Better do it now while you think of it.

Queries and Replies

REDWOOD SHAVINGS.

Editor Cultivator: Permit me to take issue with your reply to the query relative to the use of Redwood shavings, in the Cultivator of March 2nd. I have found Redwood, if fresh, poisonous to a very high degree to all tender seedlings. When I first came to California, some twenty years ago, I used fresh Redwood boards to make a flat for growing young plants and just as soon as the roots reached through to the wood the plants died. At the same time a few flats were made from boxes procured from the grocer and no trouble was found in growing perfectly healthy plants. At this time we had boarding in our family the district school teacher. This lady had taught in former years in the northern part of the State and she informed me that the owner of a lumber mill placed his mill over a stream in order to get rid of the sawdust and that the fish in that stream were killed by thousands.

People below the mill protested, and the matter went into court with the result that the mill owner was forced to get rid if the sawdust some other way. Most of us know how unfit for use is water that is first put into a fresh Redwood tank.

I have no doubt that sawdust that has been exposed to the elements for a couple of years would be ideal for seedlings. When a boy I used spent tan bark for the same purpose with perfect success, but I was careful to secure it from the pile that had lain out in the weather for several years, whereas if I had used it fresh the tannic acid would have worked utter destruction.

I know that the acid in fresh Redwood is poison to both animal and plant life and I hold the teaching of the Cultivator in such high esteem that I should be very sorry to have passed along a statement so erroneous, without entering a protest. Yours truly—Q. A. Lobingier.

The manager of the Southern California Acclimatizing Association at Santa Barbara, in answer to an inquiry, has the following to say, "This firm uses many tons each year of Redwood and pine sawdust and shavings.

"My first impression that shavings would be good for potting soil was through the observance that potted plants plunged in sawdust or shavings and 'rooted through' were in unusually fine condition and that the roots were long and fibrous and thoroughly mixed with the shavings. This impressed me to try a little in my potting compost and as there was no ill effect, I added more and more, until at last, in some cases, I used all sifted shavings. For two years, and more I have used at least half sifted shavings and never have our plants done better. No other soil holds moisture so well, and as for seed growing, I have never found anything to compare with it, the tenderest seeds doing better than in any other medium, and that is saying much. I have never found any injury from either pine or Redwood dust or shavings though I have used both fresh from the mill. They would make a fine top covering for new lawns and for mulching flower beds to conserve the moisture I have found no equal."

In California there exists a very general but erroneous impression that Redwood sawdust and shavings are injurious to plant life. This is due in part to the fact that soil coming in contact with Redwood for the first time will be discolored by the small and insignificant amount of tannic acid contained therein. The writer has used thousands of fresh Redwood seed boxes and never experienced the trouble noted by Mr. Lobingier. It may be that in certain waters the chemical properties in the two may produce an injurious effect, but through nearly a score of years in the nursery and garden trade the writer has never experienced a case of injury. Mr. Lobingier is a man of broad experience and high intelligence and there is no doubt that in the cases he mentions, the facts are as stated. We understand Mr. Wuest of Alhambra had similar experience with Redwood shavings around orange trees. "When doctors disagree who shall decide?"—Ernest Braunton.

AIR COMPRESSOR.

A subscriber from Santa Paula writes:

Will you please give me some information as to the practicability of the air compressor for raising water from a deep well for irrigation purposes? Also information as to its cost, and probable cost of operating it? My well, now being drilled, will probably be 250 feet deep, with water standing 75 or 100 feet from the top of casing."

When your well is developed some information may be given in answer to your questions. We can not give definite data or indefinite suggestions.

STUNTED EUCALYPTUS.

Editor Cultivator: I inclose a red gum tree and wish to know what is the matter with it. Myself and neighbor bought several hundred from a nursery and when they arrived we found them more or less covered with knots and we want to know if they are to be considered in a healthy state for planting?—G. C., Heber.

Eucalyptus show no disease but seem badly stunted. Trees of this height should have single stem and more slender; roots should be many and small, not club-rooted like the specimens sent. They ill probably all grow but are not first-class stock.

MILDEW.

Editor Cultivator: Will you please through your valuable columns tell what is the cause and what can be done for the peas I send by separate cover?—O. K., Orange.

Your peas are badly affected with mildew and in such a stage and when the vines are so old we do not think any remedial treatment will pay. We have lately had so much damp, cloudy weather that mildew is very prevalent on all sorts of vegetation.

VACCINATION FOR BLACKLEG.

Editor Cultivator: How many times is it necessary to vaccinate calves for blackleg? Is it necessary to vaccinate an animal after having the first calf?—C. B., Imperial, Calif.

Assuredly, we vaccinate calves twice about three weeks between vaccination. If the vaccination takes it is not necessary to renew the operation.

RUSH GROWING.

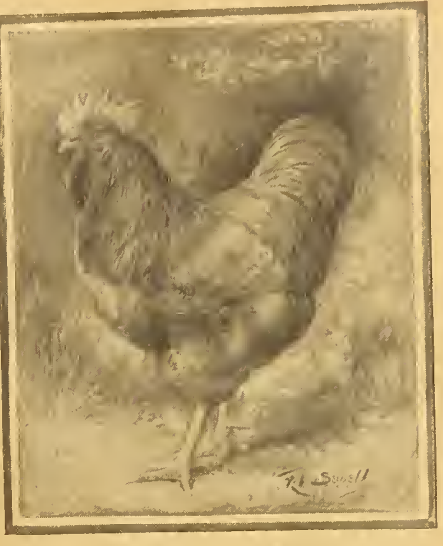
Editor Cultivator: An article appeared in the Cultivator of March 16th, on the Juncus rush; could you give more information in your next issue, regarding the price, market, etc., and how could I get the roots?—H. R. H., Forestville.

Write to Agricultural Experiment Station, Berkeley.

A GOOD FENCE.

The practical man, who wishes the latest improved and one of the most practical fences on the market will get good ideas by dropping a card o the West Coast Wire & Iron Works, 19 Fremont street. San Francisco, asking for the little booklet, "Woven Wire Fencings," "Wire Supplies for the Farm" is a slogan of the West Coast People, and they certainly put up a good fence and one which is worth investigating. Stock fence of barbwire, or netting mesh, or twisted ribbon, and they also put up a number of ornamental designs for yards and parks which are listed in the booklet spoken of.

A PRIZE WINNER AT MADISON SQUARE.



This beautiful Buff Orpington, an aristocrat of aristocrats, was a prize winner at Madison Square, New York. He won first there in 1903, and is now mated with the first pullet of the same show in 1904. Both birds are the property of Willow Brook Farm, Berlin, Conn.

The Lake Avenue Poultry Yards advertise high grade poultry in this issue. Mr. Harrison makes a specialty of several fine breeds.

O. M. Johnson of Gardena, is advertising eggs for hatching from standard bred White Plymouth Rocks.

Mrs. J. R. Cutting of Monrovia, advertises eggs for hatching from several fine strains this week.

Portable Buildings

Made in all sizes and for all purposes. Cut shows No. 48, 4-Room House, size 12 feet 4 5 8 inches wide, 24 feet 4 5 8 inches long, height of walls 7. 8 or 9 feet.

Send for Our Catalogue, which gives photographs, prices and weights of other buildings.

Burnham-Standeford Co., 522 First St., Oakland, Cal.

Chino Ranch

Water is KING in the fruitful Chino Valley.

A new 12-inch well just finished on section 12 of the Chino Ranch delivers 150 miner's inches of water.

Water is found within 30 feet of the surface.

Chino Ranch is 90 minutes from Los Angeles, on three transcontinental railroads.

Over $250,000 worth of lands have been sold since Dec. 15th, 1905.

These fertile lands are purchasable at $75 to $200 an acre, on comfortable terms.

Chino Ranch is an established, prosperous community, with all modern rural improvements.

You don't have to "pioneer" at Chino.

Call or write for special information pertaining to these fortune-producing lands.

Trains leave daily for Chino via S. P. at 8:05 a.m. 5:25 p. m.

Chino Land & Water Co.

SONGS 'O CHEER.

My Grampa he's a'allus sayin' "Sing a song o' cheer!"
And, onc't I says "What kind is them? he says, "The kind to hear—
'Cause they're the kind that Nature sings, in every bird that twitters."
"Well, whippcrwills and doves," says I "hain't over-cheery critters!"
"Then don't you sing like them," he says—"ner guiny-hens, my dear,
Ner peafowls nuther, (drat the boy!) You sing a song of cheer!"
I ean't sing nothin' anyhow; but comin' home, to'rds night,
I kindo'-sorto' kep' a whistlin' "Old—Bob—White!"

—James Whiteomb Riley.

Their First Quarrel.

"I'm not sure that Arthur and I are engaged any more," said Louise. "That's the reason I'm not wearing my ring, since you have had the goodness to ask."

"Well, I didn't intend to make you mad by asking," returned her friend, stiffly. "I suppose you'd resent it if I were to inquire what you and Arthur quarreled about?"

"Why, of course I wouldn't. Don't be horrid, dear. I'm not mad—I'm just provoked at Arthur, and I'll gladly tell you all about it.

"You know Arthur went abroad last summer on business. He kept a diary of his trip, and illustrated it with the prettiest little photographs that he took himself. Really, I never read a novel that was more interesting than that book. Arthur has such a remarkable sense of humor that he see the funny side of everything, and he has the drollest way of describing scenery and incidents.

"I don't suppose he would have written the diary if his mother hadn't asked him to. He intended to have it handsomely bound and give it to her for a Christmas present. But, of course, he brought it to me first, and I read every word of it.

"A few evenings before Christmas Arthur was at the house as usual, and just as he was leaving he asked me for the diary. I ran to another room to get it and was astonished that it wasn't where I thought I'd left it. I hated to say that it was mislaid, so I asked him if I could keep it a day longer. He smiled and said 'certainly.' I thought I would have no trouble finding it the next day, but I searched high and low for it without sueeess. That evening I was so afraid that Arthur would ask for the book that I could searcely talk to him sensibly. I couldn't bear to have him think that I'd been careless with it. But he didn't mention it, and I began another search the minute he was gone. I couldn't find it. He ran in the next morning on his way down town and said he had stopped for the diary.

"O don't take it away today. I want to show it to a friend.

"Why, you think a great deal of it, don't you?" he said, laughingly, as he ran down the steps.

"You can imagine that I was nearly distracted, for it was mortifying to think that I should have to eonfess that I had lost a book which could never be replaced. I determined to find it at any cost. I simply turned the house upside down. I looked in the most improbable places—under the beds, on the pantry shelves and in the refrigerator. But it wasn't to be found. Mother had been away for a week, and she was coming home the next day. I decided to tell her my trouble and get her to help me hunt. So when Arthur eame that evening I tried to assume a nonchalant air, and said in an offhand way, 'Oh, about your diary; I'd rather not return it till mother comes, for she may wish to see it again.'

"Arthur gave me such a long quizzical glance that I could'nt keep the eolor from rushing into my face.

"Don't romance any more, you dear little goose," he said, "for the book has been at the binders for more than a week. I came in one day when you weren't at home, and as I saw it on the table I slipped it into my pocket."

"Oh, Arthur!" I eried, "How eould you be so mean?"

"Why, I didn't intend to be mean," he said. "I was going to tell you when I asked you for it the first time, just for fun. But you were so clever in inventing reasons for keeping it that I thought it would be a good joke to keep you in the dark for a while."

"I think you are perfectly horrid," I said. "I've been so worried about it that I could hardly sleep. If you really cared for me you wouldn't treat me so. It was cruel of you to deceive me."

"Deceive me," he repeated laughing, "Why, Louise, you are the little deceiver."

"Then he actually roared. He seemed to think the incident very funny. It's not my idea of a joke and I told him so, very plainly."

"I suppose you haven't seen him since?" asked her friend.

"Well, no; you see that was only last night," returned Louise. "And do you know, I've a notion to forgive him."—Press Review.

A MOTHER'S DUTY A MOTHER'S PLEASURE.

Mothers who have entrusted to their care beings the most precious of the world's treasures, sent from the courts of Paradise to bless and cheer, what duty more clear, more soul inspiring, than the preparation of these same beings for lives of usefulness and honor.

This is the most sacred charge that has ever been committed to the care of mortals, and a blessing so rich, so glorious that all thus honored may well rejoice with exceeding gladness at being accounted worthy of this the greatest of all privileges.

Every true mother cannot but feel that a great responsibility rests upon her as the guardian of these lives, so graciously bound by the Infinite, for purpose so high and holy that we can hardly conceive of the grandeur of her heaven-born mission.

Would that all who have been accounted worthy of this divine appointed task might most keenly feel the duty they owe as moulders and builders of the destiny of a people who stand high among the nations of the world, all as a result of the high-born courage and gracious loveliness of generations of faithful mothers agone.

"The hand that rocks the cradle rules the world."

As my own conception, the first and highest duty of every devoted mother is the preparation of her child for a life which will bless and make better this present world and at last stand in the courts of eternity redeemed and purified by the influence of a saintly mother, who gently and tenderly guided through the power of a Being who will give to all wisdom sufficient for the duties committed in love and tenderness.

Those mothers are most happy who regard their duty toward their children as a joy and pleasure, and their influenee is immeasurable, incomparable and everlasting.

Would that mine were the ability to inspire every mother with a true estimate of her own greatness. To me a duty-loving, and a duty-performing mother is a creation most noble and worthy of the greatest esteem and reverence.

In ancient Greece no woman of the realm was treated with such eourtesy and gentle deference as the prospective mother. The result of this genteel demeanor is well known to students of history. In this respeet we might well emulate the ancients.

One very practical plan and one which brings results, is to treat a child with the same deference and politeness as you would an older person. This will add to his dignity and self-respect, two very essential qualities in the building of character, which is ever the highest aim.

It is never wise to deal untruthfully with children, as is so often and so thoughtlessly done. Rewards and punishments promised should be meted out with promptness and candor.

To discuss business difficulties in the presence of children is to add to them sorrow and trouble from which they should remain care free. A dear little girl of nine whom I knew poured into my ear such a tale of direful calamities as would have done justice to one of maturity. These had been so woven into her sensitive soul that her grief was deplorable.

It is well to encourage the use of correct English from earliest childhood. This may be most successfully done by great care in examples and by very gently setting forth of a correct for an incorrect expression. It takes great tact and sweetness to overcome outside influence in this particular.

As the presiding genius of the home the mother should be a queen of loveliness in all womanly virtue. And thus equipped her children should go forth as everlasting evidence of her fitness for a position so divinely imposed.

A mother's duty is a mother's pleasure,
And childhood dear her supremest treasure."

—Mrs. W. A. Preston, Imperial.

A FATHER'S FRIENDSHIP.

"There lies the best friend I ever had, except you, mother," I heard a young man say once as he stood by his mother's side and gazed for the last time at the noble faee of his father as it lay calm and beautiful in death. That is exactly what every father ought to be to his boy—his best friend; but somehow it is not uncommon for that beautiful thing called friendship to fail between father and son. The father loves the boy, he spends his life in working for him; he feeds him, clothes him, provides him a beautiful house to live in, gives him every advantage in the way of edueation, and yet, in spite of all this lavish kindness in material things, there is something wrong in the relation between them. They are really strangers to each other It seems as if a solid wall had been built between two hearts, a wall which is none the less strong because it is invisible. The son is stiff, constrained, unhappy in his father's presence, and the father feels hurt at the boy's coldness and ingratitude. But, my dear sir, how do you suppose your son feels at your apparent indifference toward him? The fact that you provide all these material things does not affeet him. They are like air and water; he has always had them. One gentle touch on the shoulder would mean more to him than all the luxury by which he is surrounded. He does not dream you love him, because you never turn the genial, friendly side of your nature toward him. You are out of touch with him completely, and this separation is your fault, not his; for a child turns instinctively toward a father's heart, and only when he is shut out of it does he go away.

This wall is of your building. You began it when he was a little fellow, and you just told him to "run away, papa is busy." That was the first stone in the pile. By and by he eeased to come to you with his little life's unfoldings, because at night you were tired and wanted to be quiet, and in the morning you were busy with your plans for the day. He felt he was not welcome. So now you see him a big strong fellow, almost as tall as yourself, going in and out daily before you, eating at the same table, kneeling, perhaps by your side at family prayers, and yet what goes on in that boy's heart and soul you cannot tell. He will not show you because he thinks—and he has good reason to think—you do not care.

BURN AIR AND SAVE FUEL
You can do it with the
HAGUE IMPROVED DOMESTIC OIL BURNER

It burns more air than any other burner on the market. Can be fitted to stoves, ranges, furnaces, and all kinds of heating systems. Simplest and most economical burner on the market. If you want the most heat for th least money, write for information to

Hague Domestic Oil Burner Co, 810 So. Spring St., Los Angeles, Cal.

Miss Alcott pictures such a case as this in one of her books very vividly, but fortunately in that instance the separation was not lifelong. There came a failure—all the family fortune was swept away, and the shock and surprise of that time enabled the son to get over the barrier and find his way into his father's heart. As the lad himself expressed it, it seemed as if the failure had come on purpose to father.

If a father influences a son's character he must have a sympathetic knowledge of what the boys cares for most. He must be in the boy's confidence. One of the easiest ways to win that is to be interested in his amusements. The father who will go swimming or skating, who will play a game of marbles or fly a kite with his boy can gain an insight into his nature, and he has a wonderful hold on him. The two are sure to be friends, for nothing charms a boy so much as to have his father for a companion in his pleasures.—Selected.

WISHING DISHES.

Dish washing is usually considered a disagreeable task, although it would not be any easy task to account for the aversion to it. It is not sloppy, dirty work unless one is careless, and the hands need not be roughened by it. Scrape all the crumbs from the plates into a bowl, and empty them into the slop pail. Do not pile the dishes up indiscriminately, but put all of one kind together. There should be a clean dish cloth or mop, and at least two dry towels. These may be of linen crash or flour sacks that have been washed and hemmed. Have plenty of hot water, fill the dish pan half full, and dissolve enough Pearline in it to make a suds. Wash the glassware first, rinse in hot water and dry quickly. They will be clear and beautifully polished. After this comes the silverware, cups, saucers and plates in order named. The cooking utensils should be filled with water as soon as the food is removed from them, and allowed to soak until you ar ready to wash them. Then a wire dish cloth is useful for cleaning kettles if the food has stuck to them. Clean tarnished silver with whiting mixed to a paste with equal parts of ammonia and water, using a flannel cloth, and polishing after it has dried. —E. J. C.

AN HONEST MAN.

Cassius R. Peck, assistant United States District Attorney of Oklahoma, will never accept a railroad pass. Those that are sent to him are always returned.

At a banquet in Guthrie Mr. Peck spoke on honesty. One thing he said was this:

"What are we coming to? Are we coming to such a pass that our ideas of an honest man will correspond with the idea of old Hiram Stroode?

"Hiram Stroode, for the seventh time, was about to fail. He called in an expert accountant to disentangle his books. The accountant, after two days' work, announced to Hiram that he would be able to pay his creditors four cents on the dollar.

"At this news the old man looked vexed.

"Heretofore," he said frowning, "I have always paid ten cents on the dollar."

"A virtuous and benevolent expression spread over his face.

"And will do so now," he resumed. "I will make up the difference out of my own pocket."

Cookery Recipes

CRANBERRY ICE CREAM.

Cook one pound of cranberries, six ounces of sugar and a few drops of carmine to a pulp in one-half pint of water, strain and add to one pint of base cream and freeze.

* * *

MARMALADE ICE CREAM.

Either lemon or orange. Mix one-half pint marmalade with one pint of cream and add the juice of two oranges or lemons or orange syrup and strain and freeze.

* * *

ORANGE WINE AND VINEGAR.

Mrs. W. of Pomona, asks the Cultivator for a formula for making orange wine and orange vinegar. Orange wine is made much as elderberry wine. The pulp is strained out; the juice sweetened, bottled and set away. It is treated as elderberry wine is, but not always with the same result. We know of no specific rule to make orange wine by and guarantee none. An old orange marmalade maker says orange wine isn't much of a success.

* * *

BAKED BEANS.

The New England cook bakes her jar of beans every Saturday and serves them for Sunday morning breakfast, and likely again for dinner, or else for an evening lunch. All families may not care for them at this time, but as a rule beans may be served once a week during cold weather without becoming tiresome. Institutions, boarding houses, and those who get up church suppers find baked beans a cheap and satisfying food.

Beans contain a large per cent. of nutriment, and when cooked with salt pork or corned beef, they form what is termed a complete food, that is, one that contains all the elements necessary to sustain life. Where beans are commonly used it is perhaps a good plan to prepare them in several ways.

Beans are baked without pork for the vegetarian and can be seasoned so that the uniniated would not dream of the omission of the cube of salt pork. To cook the beans properly without pork, bury the heart of an onion in the bottom of the pot, dissolve a little molasses, a speck of mustard, salt and a few grains of cayenne in two cups of boiling water and pour over the beans after they have been soaked over night, drained and parboiled in fresh water and drained again. Half a level teaspoon of soda added to beans enough to fill a two-quart pot will improve them if put in when they are nearly parboiled. Put two rounding tablespoons of butter cut into several pieces on top of the beans, cover closely and bake six hours, adding a little boiling water as needed. Just at the last uncover and cook until nearly dry; never stir the beans.

Unless porkless beans are well seasoned they are not palatable. If pork is added score the top with a sharp knife and bury in the beans, let brown and cook crisp by uncovering the pot during the last hour of cooking. Use one-quarter pound of pork to each pint of dry beans. Small pea beans are preferred by most cooks for baking rather than the larger kind of white beans and occasionally for a change the red kidney beans are good. Serve with brown bread.

If the modern addition of tomato sauce is liked add one cup to the beans when the beans are about half cooked. Catsup may be served with beans but never use vinegar for it hardens the vegetable protein and make it less digestible.

In her interesting paper on "A Mother's Duty," Mrs. W. A. Preston tells many things of value to parents. Among all of those we opine, none are more worthy of mention than the admonition not to burden the soul of childhood with our woes. No matter what difficulties may beset grown people, what sorrows may be theirs, keep the fact from the children. Remember they are coming, full fast, to the age of care and trouble, and now that they are in the sunshine of childhood's loveliest hours, do nothing to mar their happiness.

COLONIST RATES TO CALIFORNIA

Santa Fe

Will be in effect every day, Feb. 15 to April 7, and Sept. 15 to Oct. 31, 1906, from all points in the east and south.

Following are a few:

Chicago	$33.00	Kansas City & Leavenworth	$25.00
St. Louis	30.00	St. Joseph & Atchison	25.00
Galveston	26.45	Council Bluffs & Omaha	25.00
Dallas, Houston and Fort Worth			25.00
Nearly all points in Kansas, Oklahoma and Indian Territory			25.00

Colonist rates are also in effect from all points east of Chicago and south of the Ohio river.

Santa Fe Agents in California will take deposits of money to cover price of tickets, which will be promptly furnished to passengers at any point from which these rates are in effect.

California illustrated literature mailed free to any address or may be had from Santa Fe representatives.

Tourist Sleeping Car Lines

Colonist tickets are honored in tourist sleeping cars which run via the Santa Fe to Los Angeles and San Francisco.

A LONG JOURNEY.

It is a long way from the Equator to the Arctic Circle and anyone contemplating the trip would have to burden himself with many accessories from a palm leaf fan tǒ a fur coat.

Wherever he travels he will find dotted here and there buildings covered with Rex Flintkote Roofing which has the important advantage not possessed, by the clothing for the human race, of being an appropriate covering to a building under the tropical or under the mid-night sun.

Rex Flintkote Roofing stands the heat of the tropics with the same equanimity as is shown by the darkey who dozes peacefully after consuming a watermelon, and it gives protection against the cold of Alaska and northern Canada, which makes it the dream of the Polar bear.

Abundant evidence of the variety of buildings in all parts of the world covered by Rex Flintkote Roofing, may be obtained by sending a postal card to the manufacturers, J. A. & W. Bird & Company, Boston, Mass., which will bring full particulars, illustrative photographs and samples.

LOS ANGELES, CAL.

Nearly all of the poultrymen on the Pacific Coast, have noticed the attractive advertising being done by the Acme Mills Co., of Portland, Oregon. It is rather interesting to know how the Acme Mills Co., got started in the Poultry Feed Business.

The Ralston Purina Co., of St. Louis, Mo., are the Eastern manufacturers of the great Ralston Health Foods and some years ago they made arrangements with the Acme Mills Co., of Portland, Oregon, to manufacture these same goods for the Pacific Coast. About a year ago the Ralston Purina Co., saw a chance to put on the market something new in the way of feed for chickens and after a great deal of experimenting, they decided upon the formulas which have since given them this enormous business.

In view of the fact that the Acme Mills Co., have two of the largest rolled oat mills on the Pacific Coast, they were most admirably situated to take up this line of business. Any one familiar with a rolled oat plant, knows that in the milling of oats, there is a large amount of the oat groats which are bound to break up in the rolling process. These broken oat groats are just as good as the whole oat groats which are used to make rolled oats for the breakfast table. But owing to their smallness in size and uneven grade, the oat miller seldom uses them in making the best grade of rolled oats. Heretofore the Acme Mills Co., has always sold this product to people who are raising chickens, for these tender, little broken groats are just the thing for the baby chicks and in addition to the broken groats their daily output of oat middlings and oat shorts has been very large and a most valuable product for the chicken man.

With four mills located in the Pacific northwest, this company has an opportunity to draw from almost every grain growing district on the Pacific Coast, and in order to take care of their poultry feed business, they have built an entirely separate plant, which started to run October 15th and which has been running continuously day and night every since.

Guy H. Miller of Riverside, has sold the fine bull he was advertising in this paper to a subscriber in San Diego county and is now offering some other fine stock for sale.

The Produce Markets

Los Angeles Markets.

Los Angeles, March 29, 1906.

Butter remains unchanged, but a slump may be expected at any time, as heavy receipts are expected shortly.

Eggs are down one cent, but are likely to again advance as the continued wet weather has curtailed the supply. Poultry is also scarce and quickly taken.

Vegetables are rather more plentiful, but are quickly taken by consumers.

CITRUS MARKETS

An unusual cold snap during the past week along the Atlantic Coast caused a temporary slump in the extreme eastern market for a few days, but the market again appears active and practically all buyers are taking their usual quantities under normal circumstances. Nearly all New York handlers who have been interviewed expressed themselves as being immensely pleased with the outlook for this season and they declare almost without exception that they expect the best year that has ever been known in the history of the business.

* * *

New York, March 27.—Twenty-three cars were sold today. The market is slightly higher.

BEES AND HONEY.

The white sage honey is the most palatable and finer grained and consequently the most desirable. The little bees are very consistent in gathering their supplies and all the workers from one hive will collect from the same kind of flower at the same time. At seasons of the year when water is scarce, it is not necesary to provide it for they absorb a sufficient amount from the nectar gathered.

It is not konwn that bees have any means of communication, yet they must hear and understand to a certain extent judging from their mode of life and methodical performance of duty. They show no affection whatever for one another and are utterly indifferent to a dead member excepting to drag him from the hive.

The bee family can be put into four classes—the queen, the worker,s the drone, and the fertile workers.

The queen is easily distinguished from the bees by the length of her body. She has been known to lay twice her weight in eggs in one day, which means from three to four thousand. During the season of her usefulness she is fed well by the worker bee. Deprived of a queen the workers can make a queen out of the workers cells and when several hatch, they decide which one shall live.

The worker bee is a dwarfed female bee and is produced from the fertilized eggs of the queen. Its life time is six weeks and it dies by the loss of its wings. The cell of the worker bee is one-fifth of an inch in diameter while that of the drone is one-fourth.

Drones are not honey makers and in April the hives are rid of them. There are three sources of drones—the eggs of the fertilized queen, of the unfertilized queen and of the fertile worker.

The fertile worker is one that has been fed more and has reached a more perfect state of female development than the others. They can lay eggs but only drones are produced from them.

The eggs of the bee are very small and hatch in four days. For eight or more days they are in the pupa state and are fed a pre-digested food caller cheyme, then they are fed on pollen. After this they pass to the chrysalis state and remain there for twelve or thirteen days. They come out of this as the worker bee and for a short time their duty is to feed the young and the queen. After this they go out of the hive in their search for nectar.

The Board of Supervisors of Tulare county has passed an ordinance prohibiting the firing of any firearms on the public roads of the county within 300 yards of any house.

The carrier of the United States mail to Jamesburg from Monterey intends to put on an automobile service if the roads are in good condition when he begins to carry the mails in April.

An election will be called in Alhambra on April 12 to decide the question of issuing school bonds for $35,000 for the building of a new school, and for the improvement of those now in use.

The Index says that Salinas is one of the healthiest cities in the State, or in the United States. Statistics show that on a basis of 4000 population, the death rate per annum is only, one per cent.

The real estate dealers of Petaluma have pledged themselves not to sell any more land in that city or vicinity to Japanese. The Japanese are flocking to that city, and in that vicinity there is a colony of them.

A subscription list is being circulated in Sonoma county to secure funds for the purchase of the Wickersham estate at Sonoma, to be offered the State Commission for a site for the State Agricultural Farm. The property is located a few miles from the city of Sonoma and consists of 1500 acres.

The Sure-Go
Gasoline Engine

Is the proper one to buy to secure the best possible make for the least possible money. For any kind of work, pumping water, grinding feed, shelling corn, sawing wood, or anything else that requires a good steady power.

Our prices are the lowest and our engine the very best. For a better description please turn to your last number of the Cultivator.

A Better Way
To Go East

Than is offered by the Salt Lake Route may be available some day but not at present. Let us suggest some reasons why you should go that way on your next trip.

Because, if you came west via the Salt Lake Route you must have been so well satisfied with the service and comfort enjoyed that you want to return the same way.

Because, if you came west some other way you surely should return via the Salt Lake Route to see a different part of the country.

Because, it traverses a country full of interest, pictiresque and unique in many ways.

Because, it is the short line via Salt Lake City, where you may stop and see the sights of that Mormon city without extra expense.

Because, it runs the famous "Los Angeles Limited," one of the finest and fastest trains in the west, carrying both standard and tourist sleepers through from Los Angeles to Chicago via Salt Lake City, Ogden and Omaha. Therefore, if you prefer to travel in a tourist sleeper you may go just as fast as the passengers in the standard cars, and considerably cheaper.

Because, on the "Overland" are standard sleepers through from Los Angeles to Ogden and Denver and tourist sleepers through to Denver, Omaha, Kansas City, St. Louis and Chicago, over the various lines east of Salt Lake City, enabling you without change of cars to see Rocky Mountain scenery to your heart's content.

Because in both trains are run Dining cars in which are served excellent a la carte meals, whitch may be enjoyed at your leisure; no short stops at stations for quick lunch.

Because, well there are other reasons which any Salt Lake Route Agent will be glad to explain to you. Just call on the nearest one for more particulars, literature, etc., or write

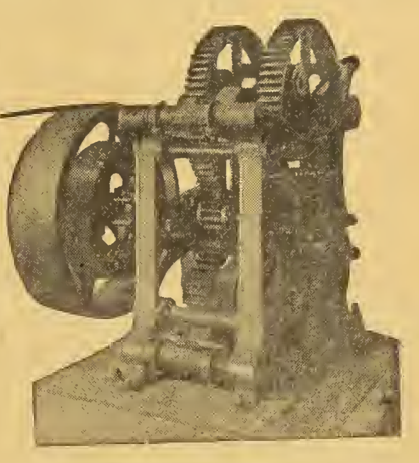
The Pomona Pump



The New Pomona Pump is now being manufactured with machine cut gears and machine cut steel or bronze pinions. The pump fitted with this kind of gearing runs as smooth as a clock and there is absolutely no noise or vibration. The company have recently taken contracts for installing their largest sized pump with this class of gearing for the Artesian Belt Water Company of San Dimas, Western Water & Power Company of Glendora and other large irrigation companies. They are required to furnish these pumps with cylinders up to 12 inches in diameter and 72 stroke which has capacity of over 60 Miner's inches of water. The valves are made entirely of phosphor bronze with ground metal taper seats so there is very little obstructiin to the water in passing through them and it is impossible to clog them with sand. These, in connection with machine cut gears, in the pump head, make a strictly high grade pumping outfit and the best by a long ways of anything on the market today.

This head and valves are both protected by United States patent. Beware of infringing as both manfacturer and user are liable.

The company has recently installed one of their latest improved heads for the Santa Anita Land Company, a subdivision of the Baldwin Ranch. Below is what the owners have to say about it:

"The new 38 pump you installed for us on our tract on the E. J. (Lucky) Baldwin Ranch is giving us satisfaction in every way. We think we have the very best that money will buy. Both as regards to pump, material used and installation. We made an excellent change when we removed the pump we had been using and installed your make."

We have pleased these people and there is no reason why we cannot please you.

RECLAMATION OF THE DESERT

FRUITS OF SANTA CLARA VALLEY

Continued from first page.

credit this county with 549,000 apricot trees and 149,000 cherry trees. The apricot is essentially a California fruit, for it grows here as it does nowhere else in the United States, and in the Santa Clara Valley it grows and produces as nowhere else in the State. So it may be safely claimed that the Santa Clara Valley is the ideal section for this fruit, and here are some of the largest and finest apricot orchards in the State. As with the cherries, the apricot ripens here somewhat later than in some other sections of the State, and therefore Santa Clara is not able to secure the cream of the early market. It is the general experience that the early fruits have no other claim upon us beyond the fact that they are early. Like most precocious things, most all early fruits are insipid and of indifferent quality. Not being in the early fruit belt, therefore, Santa Clara has produced the choicest varieties of both cherries and apricots and has based her fame on quality, which is difficult to excel. Some heavy shipments of late apricots are made to the eastern market from San Jose and these as a rule have made very good returns to the growers, but the great bulk of the crop goes to the canneries, and the reputation of the canned apricots from this place is worldwide. Undersized fruit and such as the canneries will not take is sent to the drying grounds.

While we have given prominence to the prune, cherry and aoricot as being among Santa Clara's principal productions, it must not be supposed that her soil is confined to these three fruits alone. We have mentioned these especially because in these she excels. All fruits which can be grown or are grown in our great State are found in Santa Clara County. Citrus fruits are grown, but not on a commercial scale, but peaches are produced in great quantities, there being 538,200 peach trees now bearing here, while there are 138,000 pear trees, mostly Bartletts. Santa Clara Clara County has been especially favored in regard to pears, for while nearly all other parts of the State have suffered heavy losses from pear blight it is yet unknown in this section. Some of the largest olive orchards are found in this county and oil with a world-wide renutation is produced here. The output of the celebrated El Quito groves is known wherever olive oil is used. In some parts of the county the apple has come into especial prominence of late years, and heavy shipments of this fruit are made from San Jose. Very much attention has been given to the English walnut lately, and the production of this nut promises to become an important industry here. The deep alluvial soil and the equable climate furnish ideal conditions for this tree, and the results have been equal to those in any part of the State.

In table and wine grapes, too, Santa Clara takes first rank, and the wine output of the county is both heavy and of first class quality. To summarize, Santa Clara, with her superior soil and unsurpassed climate, can produce anything she desires. She has made specialties of certain fruits, upon which we have touched, because these seem to do better here than elsewhere and to give better remuneration to their growers.

We have been led into these reflections from the fact that at the present time Santa Clara Valley is at the height of her seasonal beautv, and those who desire to see one of the most beautiful sights in nature should not fail to see the Santa Clara Valley in full bloom.

What We Poultrymen Need

What we poultrymen want is to get a first-class feed that we can depend upon to raise our chicks and raise them without a loss.

We want a feed that will raise the LARGEST PERCENTAGE of chicks—a feed that will put LIFE INTO THEM and make them VIGOROUS, STRONG and HEALTHY.

And we also want a feed that will feed the chicks the first six or eight weeks at the smallest cost, or least expense, considering the amount of chicks raised—so that we can raise chicks until two months old at a cost of about 7 cents per chick for the feed—so that we can make some profit, as we need to make the money—it comes handy to us at all times.

We want a feed that will make the chicks thrive, and keep them free from bowel trouble, and also keep them from pecking each other—a feed that will make the chicks grow so fast that they can separate the roosters from the pullets at the age of five weeks, and at the age of two months send the roosters to market and get from $4.00 to $6.00 per dozen for them.

Above all, we want the feed that will raise the LARGEST PERCENTAGE of BIG, HEALTHY CHICKS.

Feed For Little Chicks

Raise chicks—raise lots of them, so that you will have a big flock next year. To raise them successfully you must have the proper feed that will fully nourish them so that their growth will be continuous and they will become big strong, healthy fowls. It dosen't pay to be stingy with the chicks—give them the best food you can get—it means so much to them later on. For the first four weeks feed the chicks COULSON'S SPECIAL DRY CHICK FOOD, which is composed of small pieces of cracked grains, also a variety of seeds and small pieces of charcoal, meat and bone. It therefore contains a variety of the best and most wholesome ingredients in the right proportions to promote the growth of the chicks and turkeys, and fully nourish them so they will reach the average weight of **three pounds each**, from four to six weeks sooner than when fed on common food. 100 lbs. of this **Special Chick Food** will feed 400 chicks the first three weeks.

There may be many other kinds of Chick Feeds which your dealer may tell you is just as good as Coulson's. But don't be deceived; insist upon having COULSON'S SPECIAL. Your success may depend upon it. If your dealer can't supply you, send direct to factory at Petaluma.

COULSON'S SPECIAL DRY CHICK FEED
COULSON'S SPECIAL DRY CHICK FEED
THE BEST FEED FOR LITTLE CHICKS AND TURKEYS
100 LBS
COULSON'S SPECIAL DRY CHICKFEED
MANUFACTURED BY A.R.COULSON & CO
PETALUMA CAL.

A. R. COULSON, the Chicken Doctor, feeding a flock of young chickens with **Coulson's Special Chick Feed.**

This lot of 800 chicks were fed entirely on **Coulson's Special Chick Feed** up to seven weeks, at a cost of 2½ cents per chick. The first 25 days, each chick consumed an averaage of 1 cent's worth, and up to five weeks, 800 chicks were fed 400 pounds of **Coulson's Special Feed,** nothing else.

Figuring the Chick Feed at $3.50 per hundred, 4 sacks would be worth $14.00; or 1¾ cents worth to feed a chick up to 5 weeks of age, and it makes such **strong, healthy,** robust chicks, that are a pleasure to look at.

Chicks beginning life on Coulson's Chick Food—raised on **Coulson's Special Dry Chick Feed.**

Broilers sold when two months old for $5.00 per dozen.

Pullets began laying whe nfour months old. Hens that are champion layers—200 eggs per year hens, because they had the right start.

$1.00 a Dozen More

By feeding your Chicks on **Coulson's Special Dry Chick Food** they will be so large and plump that besides sending them to market sooner, you will get from 50c to 75c and possibly $1.00 a dozen more for the broilers or fryers than your neighbor who has chicks of the same age and who feeds some other kind of feed.

Try It This Year

Ask your dealer for COULSON'S SPECIAL CHICK FEED. Tell him no other kind is good enough for you. You want the best, and that's **Coulson's Special.**

FREE A nice Book **"Raising Chickens"** 104 large pages, 200 pictures. Interesting. Send 10c postage. Address Publishing Department

The Fruits of the Santa Clara Valley

By John Isaac

Now is the season when the great Santa Clara Valley is in her glory. Prunes, cherries and apricots are in full bloom and the air is burdened with their fragrance, while seen from an eminence far as the eye can reach in all directions is a vast sea of waving blossoms. We question whether there is a more beautiful sight on earth than the Santa Clara Valley in the spring and the blossom season. Excursions are run from San Francisco to the orchard sections in order to give the city people a chance to see this grand sight. and they take advantage of it by thousands. for all the trains are crowded at this time, and to take a trip to San Jose to see the orchards in bloom is a treat looked forward to with longing anticipation by the people of the city. But, back of all this beauty, there is a promise for the future, a promise of fruit and prosperity, for all this, divested of its beauty, means dollars—cold, hard cash, which more than its aesthetic feature was what the owners had in mind. Its beauty is incidental and evanescent, but its utility is positive and permanent.

Santa Clara County is the pioneer in the prune industry of the State, and she has held her position as the great center of that industry from the commencement and probably will so long as prunes are grown in California. It was in 1856, just fifty years ago, that Louis Pellier, a French sailor who had come to California in 1849, returned to his native land to bring back a wife. He brought back with him also some trees of the French prune, as we now know it, the Petit Prune d'Agen, still the favorite of all our prunes. It was a number of years before the importance of this introduction became known, but gradually the prune industry forced itself upon the public notice, until in 1870, it may be said to have fairly started, although at that time it was still in its infancy. But it had taken a strong foothold and from then on grew with wonderful rapidity. In 1870 there were but 19,059 prune trees in the State, while at the present writing there are over 9,000,000.

The prune is a very hardy tree, easily grown, and does well under any fair treatment. It is also a very sure bearer, having no off years, but bearing crops year after year during its life. Of course it is affected by climatic conditions and suffers from drought, too much water or neglect, but even in these matters it is less susceptible than many fruits. The prune is also an early bearer and when properly cared for may be expected to give some returns the third year from planting, and to yield regular crops from then on. The yield of a tree in full bearing differs with conditions. Some orchardists claim that they do not get over fifty to sixty pounds to the tree, but a yield of seven to eight hundred pounds of green fruit is not infrequent. About two hundred to the tree may be considered an average yield.

In the beginning of the prune industry enormous profits were made, and this gave a great impetus to it. Large tracts of new orchards were set out each year, and prune growing, prune drying, prune packing and prune selling became the great topics of conversation in this section. In fact the prosperity of Santa Clara Valley and of its chief town, San Jose, hinged largely upon this one fruit, and to understand how important this industry is to this section it is only necessary to think that the output of the valley often foots up 10,000,000 pounds. The labor of picking, packing and caring for this immense quantity of fruit gives employment to thousands of people, while the difference of a fraction of a cent a pound may mean the difference between prosperity and adversity for the community.

For several years past prices have ranged very low, and there has been much complaint among growers, but in spite of this fact the area of new orchards has been constantly extending, and during the present season there has been a very large new acreage set out to prunes. Efforts have been made to combine the prune growers into co-operative organizations for the purpose of packing and marketing their products, but from various causes these have not been successful, and today the industry is in an unorganized condition, each man getting what he can for his crop. Under such circumstances the grower is necessarily largely at the mercy of the middle man and the jobber, whose interests lie in the direction of getting their goods at the lowest possible price. There was a heavy shortage in the prune crop last season, with the result that prices at the present writing are much better than they have been in several years past.

Taking the industry in all its phases, cultivating, pruning, picking, processing, packing and shipping, and it gives almost steady employment to a very large number of people and puts large sums of money into circulation. Of course the picking and packing seasons are the busiest, and at this time every available person is given employment in some of the orchards, drying grounds and packing houses, and for a period of two months men, women and children all find pleasant, light, healthful and profitable employment here in some one of the various branches of the prune industry.

There are now 4,223,540 prune trees in the Santa Clara Valley, or rather in Santa Clara County, for the valley extends beyond Santa Clara County, and this number is being increased by annual new plantings. It is no wonder, then, when so much hinges on this great industry of Santa Clara, that it is the principal subject of interest, and that we hear more about prunes in San Jose than about any other thing.

But, while prunes are the one great crop in this section, and while this is the great prune section of the state, if not of the world, as it produces about onehalf of the total output of this fruit in the United States, it must not be supposed that this is the only product of Santa Clara. Cherries are a most important crop here, and this fruit does here as no where else in the state. In fact the cherry crop of Santa Clara Valley ranks next in importance to the prune crop, and while not so early as the output of some other sections, very large quantities are shipped to the eastern market, but by far the larger part finls its way to the canners, and here in San Jose is packed the greater part of the canned cherries of the State. Soil and cilmate in this valley are especially favorable to the cherry, which thrives here as in few other locations. The soil as a rule is a deep rich alluvium, with a heavy admixture of humus, formed at some remote period by the filling in of the bay of San Francisco, which even now reaches far into the valley. This has been filled in by detritus from the surrounding mountains. and has been covered with a rank growth of vegetation for ages before it was brought under cultivation by man. It is an ideal orchard soil and has shown itself the most productive in the State. This soil is also very retentive of moisture, and as the winter rainfall is usually ample there is rarely any lack of sufficient moisture to make crops.

Apricots are another of the favorite fruit crops of the Santa Clara Valley, and this fruit here attains its perfection. In fact, Santa Clara may be said to lead in the production of these three fruits—prunes, cherries, and apricots. The latest figures

Prune Curing Scene in the Santa Clara Valley

Continued on Page 314

Deciduous Fruit Culture

BY J. W. MILLS, POMONA, CAL.

CANNER'S WHIMS.

One of the problems of the peach grower is to know what variety of cling to grow for the canner. Fifteen or twenty years ago the farmers were advised to plant Lemon Cling. It is perhaps the best looking canned peach to be found and the quality is good, but it is difficult to grow them large enough to make canning sizes and that makes them unprofitable for the grower. As a consequence this variety will never be safe to plant and is almost a thing of the past as a commercial peach. Sellers' Cling became a good first in the best cling growing districts and is still a favorite. Tuscan Cling at one time was highly recommended by canners but later was condemned by certain canners and after a time was eagerly sought after by the same canners. At a farmer's club meeting in Southern California about ten years ago one of our leading canners stated that Tuscan Cling was not a good canning peach and was known to the Eastern trade as "rubber goods." However, this peach has brought good money in Southern California since then. It is a prolific bearer and is inclined to be small unless heavily pruned and thinned severely.

The best cling for canners is no doubt Phillip's Cling. It is not a large peach but it has a small pit and when peeled and pitted shows a greater amount of clear fruit than larger peaches of other varieties.

This peach was brought out by Mr. Joseph Phillips of Marysville. He was the pioneer peach grower of Yuba county, having planted four of the largest peach orchards, in their time, in that part of the state. He is now being supported by the county while hundreds of growers are getting rich from the results of his labors.

PRUNING PEACH TREES.

The constant number of inquiries regarding spring pruning of peach trees makes it advisable to reiterate advice on the subject. There is a common notion that late pruning is injurious to the peach tree. This is not the case and could all peach trees be pruned after the spring growth starts, it would be just as well and perhaps better for the trees. When trees are pruned early in the winter, large wounds do not heal over as quickly as when the cut it made late in the spring. The reason is that the stubs dry out when cut early and the new growth that heals over the wound, starts lower down. It will be noticed that when a branch is broken by the team during the season of cultivation when the trees are in full growth, that the wound begins to heal over almost immediately and very often completely grows over before fall.

The chief disadvantage of spring pruning is that it comes just at the time the rush of spring work comes on. For this reason it is impractical on a large scale. In such cases, the heavy pruning should be done when convenient any time after the leaves begin to fall. The light pruning of the small branches may be done at thinning time. At this time go in with the hand shears and cut back the small fruit bearing wood so that the fruit is properly thinned thereby.

The effect of this manner of pruning was ascertained at the Pomona experiment station some years ago. Four trees of equal size and thrift were selected for the test. Two of Old Mixon Cling and two of Morris White. One tree of each variety was thinned by hand in the old way, that is the fruit was thinned to about eight inches apart on the branches. The other two trees were pruned with the hand shears, cutting the branch so that the proper amount of fruit remained even though it hung in clusters. At harvest time there was no difference in the size or quality of the fruit on the trees thinned in the two different ways. Prof. A. R. Sprague had a similar experience with his peach trees in his Antelope Valley orchard. Part of his orchard was thinned in the regular way, but the work became so long-drawn out that he saw that a more rapid method must be employed so he put his men to work with the hand shears and clipped part of each heavily-laden branch. When harvest time came there seemed to be no choice so far as the quality of the fruit was concerned, but the pruning method was the fastest and cheaper method of thinning.

The point brought out is that a tree will properly develop a certain amount of fruit and it makes no difference whether it is evenly distributed or not. A cluster of several fruits at one point will not weaken a branch but will develop, and it will be larger between the fruit and the main branch that it is beyond the cluster of fruit. Anything that will stimulate the circulation of sap will make a proportionate increase in the building up of tissue, and nothing will do this more efficiently than a cluster of fruit.

THE AMERICAN FIG.

Fig growers in California will be interested in reading an account of how the Smyrna Fig of America is picked and handled in its native land.

United States Consul Norton, of Smyrna, has sent to Washington a report describing the methods of gathering and packing the Smyrna fig for market which possesses some very interesting facts for the lovers of the fruit.

The fig district of Smyrna lies largely along the line of the Smyrna-Aidin Railroad. Trees begin to bear in their sixth year, and in full vigor in their fifteenth year. Fig trees on the low plains yield fruit which is much larger and richer in saccharine matter than those in higher altitudes. They often suffer, hoever, from an excess of moisuture in unusually wet seasons when groves on higher ground are less harmed, owing to the facilities for drainage.

The fruit ripens about the middle of August when it is picked and dried in the open air for from three to six days It is then packed in sacks of about 250 pounds each, two of which constitute a load for a camel, and are transported to the nearest railroad station. After arrival at Smyrna camels also transport the sacks to the warehouses of the dealers. Carts are not employed, because the fruit is liable to be damaged if the sacks are pilled on top of each other. The arrivals from the country are promptly purchased by the various great packing houses, which have each a large corps of employees, chiefly women and girls, for the operations of sorting, washing, drying and packing the friut for the market. This means work for many thousands of the population of Smyrna during the months of September and October, and the average degree of prosperity among the lower classes during the entire year depends largely on the amount of money set in motion in this short period.

The sorting of the figs is done with great care. Color, but more especially size and thickness, or, rather. thinness of skin, guide the classification. The inferior grades are eliminated and sold for purposes of distillation. A certain quantity of this grade is exported to Austria and Hungary and used as a substitute for chicory. The delicate flavor of Vienna coffee is due to the presence of dried fig powder. The better grades are prepared for export in various ways. The least expensive packing is linen or other bags, hich are used for the less valuable qualities of figs. The finer grades are subjected to a certain manipulation before being tightly packed in boxes containing fro mone to elevn pounds. During the manipulation the workmen constantly dip their fingers in sea water, the result being that the fruit is better preserved and its sweetness is not diminshed by long keeping. The term "macaroni figs" is applied to fruit which has been gently rolled between the palms of the hand, so as to resemble an elongated elipsoid. "Loucoum figs" are prepared by pressing the fruit into a reçtangular form, not unlike in size and appearance the oriental confectionery known as "Turkish Delight," or "loucoum."

The great majority of the choicer figs are packed in layers. The upper side is split, and the fig is flattened out. This method permits expert manipulators to give a more presentable appearance to small figs than is possible in preparing the "macaroni figs" or "loucoum figs." The latter two methods, however, are the most favorable for proper curing during transportation. Boxes of figs prepared by either of the three methods are usually exported in crates, holding about 330 pounds.

The smyrna fig crop of 1905 was exceptionally large, more than 20,000 tons, but it was all sold at fine prices, and an exceedingly small stock has been left on hand. There is much speculation in the trade, and a good share of the crop is always sold long before it is picked. Negotiations for any considerable supply have to be made well in advance of the harvest.

A FINE COUNTRY HOME.

Through the courtesy of Mr. E. C. Hitchcock, editor of the Fullerton News, a representative of the Cultivator last week enjoyed a drive through the magnificent home ranch of Mr. C. C. Chapman. just outside of Fullerton. On this ranch Mr. Chapman has built a modern residence surrounded with spacious well decorated grounds. For a background he has an extensive orchard of the most heavily-laden orange trees we have ever seen. It was from this famous orchard that the "top notch price" oranges were sold a few weeks ago, bringing the heaviest price per box of any ever sold in the open market. Few country homes in the State take rank with Mr. Chapman's.

Southern nurserymen say they think that oranges are more hardy when grafted on the "hardy orange" Citrus trifoliata. This does not accord with the generally accepted view that the stock does not influence the cion.

Plant Loganberries

For profit. We are prepared to purchase the fruit and, in fact, all kinds of small fruits, even if too ripe for other uses. If you have

Practical Farm Science

BY PROF. A. J. COOK

SAVE THE WAX.

Since, by the use of comb foundation we can secure far more even and desirable combs, and can also secure larger profits from our bees, we must see to it that we preserve all comb which should be melted up into wax. The amount of wax which can be saved in a large apiary in a year is indeed, surprising, and will help materially to swell the profits from the bees. All cappings, for these furnish very fine wax, which are cut from the combs of the extract, should be put into a can to drain and later melted into wax.

The solar wax extractor is very convenient and serves admirably to help us preserve the comb and render it into wax. This is simply a shallow box lined with tin, about three or four feet square, with a double cover, one simply of glass, and the second of wood, lined with glass over black cloth. This last serves as a mirror and also as a reflector to concentrate the sun's rays, and thus adds to the heat of the extractor. This cover is open during the heat of the day, and at such an angle as best reflect the heat rays. The other glass serves to confine the sun's heat and thus this extractor becomes very effective in all days of hot sunshine during the season. We have only to throw pieces of comb into this box to secure the wax. A tube at the bottom in one corner serves as a nozzle, and helps to empty the wax from the extractor.

The old-time Swiss wax extractor was a tin vessel, within which was a second one, made of perforated metal, which received the comb. This had a close-fitting cover and the whole was set over a kettle of boiling water. A tubular nozzle permits the wax to run out as it melts.

A wax press is one of the late improvements in this matter of securing the wax in our surplus combs. The wax is melted by placing the combs in boiling water, when all is put into a form, much as the ground apples are placed in when we desire to express the cider. As with the cider press, a cloth holds the comb. By applying the pressure while all is still hot, the wax can be very perfectly extracted.

Of course the oldest and crudest way to extract the wax is to place all the combs in a cloth bag and submerge all in boiling water. As the combs melt the wax passes through the porous cloth bag and rises to the top; so that in the end, after the water cools, we have our sheet of wax. Occasional kneading or stirring the mass in the bag makes the work more thorough. If we secure our wax by use of this crude process we must be cautious not to let the bottom of the cloth bag touch the bottom of the kettle or it will burn. An inverted pie pan in the bottom of the kettle will prevent such an evil result. If the wax is not clean, the lower impure portions can be scraped off and remelted. The cakes should be entirely free from impurities.

LARGE HORSES.

In my observation in Germany, I see that large teams are thought to be a necessary adjunct to the farm. In this respect England and France can learn a valuable lesson of Germany. Indeed, if we may except our own United States, Germany leads the world in education applied to the practical arts of life. She spares no effort to learn the cause of things, and then she puts in practice the rules that science has shown to lie at the foundation of success. Germany's unparallelled progress, even with the handicap of her great army which she supports so generously. has largely depended on this thorough research work, which is carried on everywhere in all departments of business.

DEEP PLOWING.

I have believed for years that one of the most common mistakes of our orchardists in Southern California was too shallow cultivation. I am convinced that one of or two deep plowings each year, at the beginning and close of the winter rains, are most desirable. In my study of German methods, I find that this deep plowing is the common practice here. Indeed, they are ahead of England, France and even America in their general practice of this deep thorough cultivation. They often plow fifteen inches deep as I am told by those who have given to German agriculture thorough study and investigation. Theory is all on the side of such cultivation. We know today that the office and work of soil bacteria in all vegetable growth is most important. That the necessary soil changes may occur; these minute vegetable organisms must be present and vigorous. Nitrification is just as important as seed or sunlight. But nitrification is solely a microbe process and so all successful agriculture must take account of these microscopic organisms. But the healthy action of these Lilliputs demands air and moisture in generous supply. This can come only in a loose friable earth bed. Such a condition demands deep culture. The same practice of deep stirring of the soil also conserves the moisture which the plants, no less than the bacteria, must have at call if the maximum growth is secured. In such arid climes as California and Arizona this conservation of moisture is all the more imperative I am thoroughly convinced that in nothing is California agriculture as generally practiced so lame as in the shallow culture which prevails in most sections among the orchards. I have word that in one large orchard in Southern California last year the net profits were 40 per cent. on the valuation of the orchard. In this orchard I have noticed the deepest, best culture that I have witnessed in all my observation of orchards either in America or Europe. While I am aware that post hoc is not always propter hoc. I am very certain that it is in this case.

Deep culture by plow in fall and spring and by strong, long, sharp-toothed cultivators during the summer means much, and fancy fruit, and it is such fruit that always catches the market.

PRUNING GRAPE VINES.

Muscat grape vines should be pruned with two or three buds to each cane. When they are on a trellis or arbor, the canes on the long permanent branches should be pruned the same way. Different varieties of table grapes are pruned in different ways. Tokay, Cinsaut, Malvosia, Black Morocco, Napoleon, Olivette and Verdal are pruned short. Almeria, Emperor, Purple Damascus, Golden Queen, Black Corinth, and all the Persian varieties should be pruned long. This is only a partial list, but contains the more common sorts.

THE PEAR BLIGHT

The following statement of the work acomplished in the fight against the pear blight in California was made by Prof. M. B. Waite at the close of the present season's campaign of education.

"We are not entirely satisfied with the results achieved in the eradication of pear blight in California. Our hope has been to completely exterminate the blight in this State, just as the foot-and-mouth disease was exterminated in New England. Our ambition was to stamp out the disease along the same lines in which pleuro pneumonia was stamped out of existence in the United States. Perhaps we should be satisfied with control, even if we cannot accomplish complete eradication. In my recent trip over the most infested districts, it has certainly been a pleasure to find the thoroughness with which the work has been done in certain orchards. One of the best worked orchards in the State is that of Mr. Howard Reed, near Marysville. Mr. Hayward Reed, of Sacramento has several large blocks of Bartlett pears, aggregating 25,000 trees, which have been very well treated. The work of Mr. Henry Brink, between Vacaville and Winters, has been strictly first class and is remarkable in that he followed the blight well down into the roots and eradicated the same after digging away the soil. In the Vacaville district there are a number of very well worked orchards; on the other hand, there are a number of large orchards there containing numerous cases of hold-over blight. Altogether, there is more hold over blight in the Vacaville district than anywhere else in the State. The large pear district south of Sacramento has had more good work done in a connected series of orchards than elsewhere in the State. Most of the orchards in this district have had each tree inspected by the Government, State and County experts. Certainly more than 90 per cent. of the orchards along the river, below Sacramento have been well handled. Doubtless, nearly as large a per cent. of the trees north of Sacramento have had the same careful treatment, but the pear blight experts have not been able to reach them all in the final inspection. Possibly the froce of men engaged in this work should be satisfied with the first year's efforts. Pear blight is such a new thing to the California orchardist and to the laborer employed in the orchard that all of us are working at a great disadvantage. A great deal of time of the men employed has been spent in instruction work and in finding and correcting the mistakes that are made. In the future we hope to have the majority of the California orchardists as experts in pear blight eradication, so that the labor can be properly supervised and instructed. Ultimate success in control or in complete eradication will ultimately depend on the thoroughness, intelligence and skill with which the orchardists themselves carry out this work.

The increased interest that has developed as the campaign proceeded is one of the very satisfactory phases of this work, and gives a hopeful outlook for the future.

The results of this winter's work will begin to appear upon careful examination of the blossom clusters about two weeks after the petals fall. Upon close looking, the shriveled and blighted flower clusters may then be found. By the middle of May the spread of blight in the twigs and branches will have occurred so that no one could fail to observe it.

The amount of blight which spreads from the hold-over, which has either been accidentally missed or carelessly or purposely left in the orchard, can not be predicted. It varies greatly according to the weather conditions. Last year it was much less in the Suisun valley and the river districts south of Sacramento than elsewhere in the State. It is to be hoped that the spread will be moderate this year and that the results of eradication will show so distinctly that renewed confidence will come to the grower in his fight against this disease.

I have been asked repeatedly during the last few days whether the growers should keep on cutting out blight during the spring and summer. We think it desirable not to attempt eradication of last year's hold-over during the blooming of the pear. It is especially not desirable to dig up the trees which have the blight running down into the roots, as the chances for infection of the blossom will be increased. Cutting out of new blight on the flower clusters and the twigs will do some good, however, depending entirely on the distance below the blight that the cut is made. In winter cutting on the dormant tree, one can cut three or four inches below the disease. In summer cutting, one to two feet on small twigs and even three to four feet on large branches below the slightest discoloration is necessary for success. There are two causes of failure in summer cutting: First, the failure to get below in all cases the advancing margin of the blight; and, second, the new infections which have not discolored the tips of twigs sufficiently to be seen. These develop a few days after the trees have been gone over into well marked cases. Summer cutting of blight, therefore, is apt to result in discouragement. Some of the cases are reached and headed off; others are not.

Something can be done toward checking the blight where it appears abundantly in blossom clusters by practicing moderation in the spring and summer cultivation. I saw one orchard on the Feather river bottom which made over four feet of growth last year without even plowing.

Where irrigation is used, as in the foothil orchards of Placer county, if blight appears abundantly in a given orchard, the amount of water used should be reduced to the smallest quantity necessary to maintain the health of the trees.

I regret to say that only a few orchards have been thoroughly sprayed with the thickened lime-sulphur-salt wash as recommended. While this is secondary to the main treatment, and does not remove blight from the tree which is sprayed, still it is a very important method of holding the blight in check during the critical blooming period. It is, therefore, worthy of more attention than it has received in this State. It enables the orchardist to temporarily seal up the blight concealed under the rough bark on the bodies of the trees and prevent its getting out on the blossoms."

NORTHERN WALNUTS.

Mr. Felix Gillet, a large walnut grower, calls attention, in the Oregon Horticulturist, to the fact that while the Mayette and Franquette walnuts, on account of their large size, are the favorites for desert nuts, there is also a large demand for Chaberte nuts for the use of confectioners. The meats of the various fruits named are too large for use on cream candies, etc. Confirming Mr. Gillet's statement, we notice that eastern trade papers report that the supply of Chaberte walnuts in France has already become exhausted this season, and that prices on that variety are at present so high that Chaberts cost 27 1-2 cents per pound laid down in New York.

With the Citrus Growers

BY J. W. MILLS

MAINTAINING FERTILITY OF ORANGE GROVES.

A good portion, we have found, of the orange growers have an idea that peas or vetches, if grown for sufficient length of time, will entirely supplant commercial fertilizers. This has been suggested by men experienced in eastern orchard work. but the orange seems to be so susceptibe to conditions and elements of soil that it seems certain that it is in a class by itself as far as the question of fertilization is concerned. There is one extensive grower in Riverside who has demonstrated to his satisfaction that it pays to use commercial fertilizer no matter if he does grow peas and add stable manure. He has made experiments in five acre blocks, using a cheap plot. The Cultivator may give the detailed result of these experiments at some future date.

One of our small growers recently inquired if it were advisable to use tankage at $50 per ton on a portion of a grove where the trees had turned yellow. A big crop of peas had been grown over the entire tract, but a "commercial expert" had advised her to buy some of his $50 tankage and use it. Our advice was not to try it by the ton but by the unit. At $50 a ton, tankage would have to be mostly nitrate of soda. Pure nitrate of soda can sometimes be bought for that money. As long as growers buy by the ton some unscrupulous fertilizer men will continue to bleed some of them.

THE RIPENING OF ORANGES.

This work is in connection with the systematic study being made by the writer, of changes that occur in fruit during its growth and ripening. The oranges increased in actual weight of total solids and sugars from the beginning to the full maturity of the fruit. At all stages of the growth of the fruit the total sugars are divided about equally between reducing sugar and sucrose. The marc of the orange is formed very early in its history and remains constant in weight during its growth and development. The acids are also formed at an early stage and apparently increase gradually, but almost imperceptibly. Storage of the fruit at all stages of its development results in slight loss of total sugar, a marked increase of reducing sugar, and a corresponding loss of sucrose. The loss of total sugar noted above is to be explained as in the case of apples, by the consumption of reducing sugar as a result of the respiration of the fruit. The weight of marc remains practically constant and the weight of acids appears to decrease slightly on storage during the various stages of development of the orange.

"SCIENCE."

SOUR-SAP AND GUM DISEASE.

The name of "sour-sap" applied to deciduous fruit trees has more than one form. The sour sap that kills peach trees with wet feet is entirely different from that which sometimes kills apricot trees in April. The death of stone fruit trees which stand in water is due to the fact that they are standing in the water. Their trouble may be detected by a peculiar, sweet odor that is sent off from them. The first visible sign is a slight wilting of the leaves, which are usually forced prematurely. When any of these signs are apparent the trees are "gone," and there is nothing that will save them.

Apricot trees are often affected with a fermentation of the sap. That is altogether different from the above described trouble. It occurs at the time of the rankest growth.

These diseases are supposed to bacterial, or are due to a certain fermentation. In either case it is judicious to guard against scattering the germs. Where there is evidence of gum disease, dipping the shears in a solution of bluestone water between trees will stop contagion by pruning. We have seen orchards where the trees in small areas were totally destroyed. The gum disease seems to come and go. The last serious infection in Southern California orchards came during the series of dry seasons of a few years ago. It would appear that trees growing under stress of adverse climatic conditions suffer most. At any rate, during those unfavorable seasons, and especially the last few this gum and blight on apricot trees were the most severe. Some trees had root knot and some had no sign of it. This disease seems more common in Southern California than in the north. Our warm February weather, followed by cold chilly weather, seems to take the edge off of the thrift of certain varieties. This has not been demonstrated as a fact. but indications point that way judging from the fact that the trouble is chiefly in sections subject to such climatic conditions.

Splitting the bark on two or three sides of the tree will relieve gum affected apricot trees. If the gum is allowed to collect beneath the bark it will force itself around until the tree becomes girdled. If the gumming is not accompanied by fermentation splitting the bark will cause the tree to start a vigorous growth and quickly recover. The bark should not be cut on trees which show no signs of gum. We offer this as a precaution, as the idea sometimes prevails that what is a cure is also a preventive, while in fact it may be the means of spreading the disease.

SHIPPING ORANGES TO ENGLAND.

There have been many efforts at various times to ship oranges from California to the London market, some of which has been exceptionally successful from a financial point of view, and some indifferent. As a rule, the fruit which arrives in good condition commanded the admiration and a good portion of coin of the English public.

This year the Western Produce Company, Limited, of London, began the season with several shipments; the forwarding agents at this end being the Spence Fruit Co. Mr. H. E. Collins, of the Agricultural Chemical Works, who advises with the Western Orchards Produce Co. regarding conditions at this end, furnishes us with some information regarding these shipments, and especially with the letter which follows.

As we noted the fruit which arrives in good condition and is strictly high grade has commanded ready sales and good prices, but unfortunately the long shipment with sometimes indifferent packing has caused some decay. The letter is from the Honorable Secretary of the Scientific Committee of the Royal Horticultural Society and is a report on the conditions of this decayed fruit, the possible cause and prevention. The following is the letter:

London, Feb. 16th, '06.

Dear Sir:—The oranges you send were attacked by the "fungus Penicillium digitatum," a frequent cause of loss among oranges. The trouble usually appears after the oranges are packed and on their way to England, and this appears to have been the case with those you send. Navel oranges are frequently attacked, the open eye of this fruit forming a convenient place for the entry of the minute fungus spores; sometimes, indeed, they are infected before they leave the orchard, but more frequently in the curing house. After packing the disease may spread throughout a box from one fruit to the next.

The conditions for the growth of a fungus such as this are particularly moisture, warmth and a suitable material upon which to grow. In the Navel orange a drop of water will often condense in the open end, and there the fungus finds a very suitable place for growth.

The best means of preventing the growth of the fungus in the fruits appear to be as follows: Wrapping fruits in tissue paper which, combined with some amount of ventilation, has within certain limits proved very valuable as a preventive of decay. Careful destruction of all the decaying fruits in the orchard or in the packing house is most important, since this destruction will much lessen the number of spores which would otherwise be floating about in the air. This should be combined with disinfection of the packing houses, either by thorough drying by whitewashing, or by burning sulphur in the houses.

Probably the means of destroying decaying oranges is by means of deep burial or by fire.

If I can make any point clearer on the foregoing, or if we can be of assistance in other direction, please let me know.

I must congratulate you upon your fine fruits.

Yours very truly,
Signed:
F. CHITTENDER.
Non. Sec. R. H. S. Scient. Com.

There are doubtless in the above hints of value to our shippers. At least, will be of value when the market in America is such as to encourage foreign shipments, especially the export rate made by the trans-continental lines combined with the trans-Atlantic lines is such that it only costs about ten cents per hundred more to place a box of oranges into the London market than it does in New York. Of course, at this time, when the home market is especially fine, there is little disposition to risk the long journey, but with the hints above and the common sense of the American shipper, the English market should be developed far more than has ever yet been done.

Los Angeles, California

ORANGE TREES
Oldest Established Citrus Nursery in California, at Alhambra, Los Angeles County

Late Valencia and Washington Navels, Lisbon and Eureka Lemons. Guaranteed true to name. No better trees in this State. Lowest market price. Three-year buds, four-year roots. Horticultural Commissioner's certificate. Order early, as good trees are scarce. Inspection invited.

E. G. Wood, Owner, at Nursery or Room 732 Huntington Building, Los Angeles, Cal.

In the Vegetable Garden

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

THE VEGETABLE GARDEN.

Soil and natural drainage must be considered in selecting the location. A light sandy loam is usually preferred, but fine vegetables are grown with ordinary care on heavy dark soils, on sticky clays, and on sands apparently no better than the seashore. A mellow, rich soil which will hold moisture well is easily recognized, and should be chosen if available; but hardly any soil need be rejected as impracticable until tried. Good natural drainage should be sought. Marshy or even damp ground will call for much labor and expense to make it fit for use, though in dry climates without summer rains, like our own State, such lands are often selected by the market gardener. The character of natural drainage can best be determined by observation of the lay of the ground, of the appearance of the soil, and of the vegetation it has borne.

The size of the garden plot should depend on the size of the family and their taste for vegetables; also upon what vegetables are to be grown as field crops. A quarter of an acre is considered sufficient for a garden for a family of four. If potatoes, cabbage, corn, and melons are to be grown in it this estimate is hardly sufficient; but if these vegetables are put in the field, as they should be, usually less than half an acre will be enough, giving room for early potatoes and sweet corn.

OUR RASPBERRIES.

The American raspberries, for there are two types of them—the red and the black—are both familiar to every lad who has passed along the highways of the older States. These berries are aborigines, and, like many other native plants, were entirely neglected by the early settlers until they proved to their own satisfaction that the raspberry of the garden of their native land could not be successfully grown in the new country. They then turned their attention to what Nature had placed before them, and from the wild berries of the clearing have come the American raspberries as we know them today.

MULCHING VEGETABLES.

Most farm gardens are made with considerable enthusiasm is the spring. Many of them are tended carefully at first, but with the approach of dry, hot weather, just when they need attention most, they are generally neglected. Any method of garden culture, therefore, that requires practically no labor during the summer months when the rush of farm work is greatest, certainly invites careful attention.

The use of straw mulch in place of cultivation to conserve soil moisture and prevent weed growth in gardens is no new thing. Mulching has found restricted use in vegetable and fruit gardens for many years. Potatoes and strawberries have probably been mulched more than any other crops, but several other vegetables have been occasionally grown in this way, and cultivation in small-fruit gardens, vineyards, and even orchards, has been not infrequently supplemented by mulching. In many cases very satisfactory reshlts have been reported from the use of mulches. Considerable attention has been given the subject by experiment stations in various parts of the country, and a majority of the tests resulted in favor of mulching.

SHADING STRAWBERRIES.

Experiments in shading strawberries carried on for two seasons and in three localities in an Eastern state gave fair results for home plots, though as managed the practice has not proved profitable in growing fruit for the general market. Only when a thin cheese-cloth was used was any increase in yield obtained, while with a moderately heavy cheese-cloth there was a marked decrease. In no case was the increase in yield sufficient to pay for the added cost of shading, which is estimated to be about $350 per acre.

Shading produces a considerable larger berry, and in some cases one of better general appearance. For these reasons the practice may be adapted for the growing of fancy and exhibition fruit or for home purposes.

Shading introduces something like hot-house conditions. Aside from its value as a protection against frost, its beneficial effects are due in large part to the protection it affords from wind. Evaporation and transpiration are much reduced, resulting in great economy of soil moisture. The temperature of air and of soil is raised somewhat, resulting theoretically in more rapid growth, provided these results are not offset by too great diminuation of light. Interference with the access of light is the weak point in shading. The cover must be of such material as to transmit the largest part of the light. It is noteworthy that the varieties that have given best results under cover in the tests, Marshall and Brandywine, are two of the varieties known by experience to be among those best adapted for growing in California.

GARDEN FERTILIZERS.

Of leading importance in preparation of the ground is the supply of plant food, of which the chiefest essentials are nitrogen, phosphoric acid, and potash. It is important that any fertilizer used to supply these elements should be thoroughly distributed through all the soil to be reached by the roots of the plants, and this distribution must be completed before planting. Turning and returning the ground and harrowing again and again are useful for the purpose.

A wise selection of fertilizers can not be secured by rule; it is very largely a matter of experience. A sandy soil is often deficient in the essentials of plant food, while a clayey soil contains them in abundance, especially potash. A limestone soil is likely to contain a considerable proportion of phosphoric acid. What is good fertilization on a given soil for one crop may be very unsatisfactory for another. Where it is the purpose to establish a garden permanently, it will be profitable to determine the need of the soil for fertilization by close observation of results from year to year. It will be well to make notes of important points. Not only will the facts thus gained be useful for future gardening, but they will often find application in the larger operations of the field.

THE PEA AND BEAN FAMILY.

The word legume is used by botanists to denote the one-celled two-valved seed pod, containing one or more seeds, borne by plants of the botanical order Leguminosae. The most common representative of this family which are used as food are the various kinds of beans and peas. In common usage the term is applied to the plants themselves, which are hence called leguminous or legumes. The term pulse is also somtimes applied to this class of plants. The papilionaceous or butterfly-shaped flowers and the pendant pods of the pea and bean are familiar in every garden, while the ripened seeds of the pea, bean, lentil, and peanut are among the standard food stuffs offered in our markets. Taking the world over, the legumes are, next to the cereals, the most valuable and the most extensively used among vegetable foods. The seeds are eaten green, either alone or with the pod, as in the case of string or snap beans and edible podded peas, and also in the fully ripened state, as split pea, dried bean, lentil, and peanut. Most species of the pea and bean have been greatly improved by the gardeners' art.

The Ornamental Garden

BY ERNEST BRAUNTON

COUNTRY LIFE.

There is a certain dignity about country life; country boys and girls who become city men and women know more than those who never heard of nor saw a back-log on an open fireplace, a foot-log across a creek, or a grapevine swing on the pleasure ground; who never went nutting in the fall, nor picked the wild berries fresh from the vines in the summer. Albeit such knowledge and the associations may or may not be of commercial value, yet these country boys and girls make the happiest, the best and most useful citizens in cities, towns or country.

CHRYSALIDOCARPUS LUTESCENS.

This palm, which usually goes by the name of Areca lutescens, is popular for home decoration, being second only to the so-called Kentias. It is not nearly so hardy as the latter, nor will it stand the same amount of abuse, but its foliage is finer and its general habits more graceful, though its color is not so good. For the latter reason it is not so common in California as in bygone days.

A HARDY EUCALYPT.

Eucalyptus Gunnii has rather a wide range, being found from South Australia to New South Wales and also in Tasmania. but always on the higher mountains, and in a dry soil. It is one of the smaller species, its height in its native country being given as about 30 feet. Is said to be perhaps the hardiest of all the species, and experience shows that it is really hardy even in the south of England and Ireland.

NIGHT-BLOOMING CEREI.

These old garden favorites are the best known, no doubt, of all the Cactus family, and are quite generally grown throughout the world. The C. grandiflorus is the most popular of this section, by reason of the delightful fragrance exhaled during the short life of the flower. The name, "Night-blooming Cereus," is generally applied to all the climbing, nocturnalblooming of the genus. Cereus grandiflorus is itself very variable both in plant and blossom, and has been so extensively hybridized with other species, that it is often difficult for the best posted cactus sharps to recognize it among a general collection. All are natives of South America, Mexico or the West Indies.

KEEPING POINSETTIAS.

With regard to the plunging of the ends of the cut stems of Poinsettia bracts in boiling water to keep them fresh and prevent their drooping when cut, the loss of the milky juice or sap is the cause of their flagging so quickly, and the action of the boiling water is to seal up the pores of the wood. Plunging the ends of the stems in cold water, or such as is used for watering the plants in the house in which they have been grown, also answers the same purpose, but this must be done at least twelve hours in advance of the time the bracts are required for use. The use of boiling water has this advantage—the bracts can be used directly after, as bleeding ceases quickly.

RURAL LANDSCAPES.

In the business portions of cities, the laying out of streets in rectangle form upon nearly as level a surface as possible is essential, but in the residence portion, especially in the suburban or rural districts, the undulations of the ground should be heeded, giving some of that picturesqueness which mav be so charming a quality in an otherwise uninteresting quarter. Often depressions are filled, or hillocks with their accompanying foliage cut away in order to make things look trim, thereby giving a sameness and monotony, so undesirable in landscape architecture.

RUDBECKIAS.

These North American plants are very showy in autumn, and form pleasing contrasts to other flowering plants in beds and borders from spring to late fall. The one known as "Golden Glow" is the best species of all; the flowers are bright yellow, showing up conspicuously all the summer. Other kinds worthy of a place where room can be found for them are R. speciosa, R. laciniata, R. purpurea, and R. subtomentosa. Rudbeckias are compact, and the flower-stems are thrown erect well above the dark green foliage. They are not fastidious as to soil, any fairly good garden soil appearing to grow the plants well. Increase is readily effected by dividing the root-stocks soon after flowering is past, or, indeed, any time during the resting period. All the species above mentioned are perennials, but an annual well worthy of a place in borders is R. bicolor. This rarely exceeds 1 foot in height, and the individual flowers resemble those of R. speciosa.

HARDY WATER LILIES.

Now that it is nearly time to prepare for planting aquatics, some of our readers may be interested in seeing a list of the possibilities in hardy water lilies.

Nymphaea odorata, the common wild variety of the east, is too well known to need description. Nymphaea odorata Caroliniana is a variety producing flowers of a delicate flesh color tinted with salmon. They are equally as fragrant as the white, and the plant blooms for a longer time.

Nymphaea Brakeleyi rosea.—This is a hybrid from the best form of N. tuberosa crossed with N. ordorata rosea. It is a very vigorous grower, increasing rapidly by branches from the main rhizome. The original plant produced leaves sixteen inches in diameter and flowers eight inches across. The latter are of a beautiful shade of pink, and possess the richest and most powerful fragrance of all hardy varieties, surpassing even N. ordorata in this respect. The plant flourishes in any rich soil, and is desirable for the water garden, or for deep water in natural ponds.

Nymphaea candidissima is a large-flowered form of the native water lily of England. Its waxy white flowers, six inches across, are of exquisite form, and are freely produced both early and late.

Nymphaea Marliacea carnea is a vigorous variety; flowers, soft flesh pink.

Nymphaea Marliacea rosea bears large fragrant flowers of a rich, deep pink color, and is one of the most desirable varieties.

Nymphaea Marliacea chromatella. A variety of free growth and easy culture, blooming from early spring till late autumn. Flowers lemon-yellow, with bright orange stamens. Leaves blotched with brown.

Nymphaea Robinsoni.—The large floating flowers of this French hybrid are of the most brilliant orange-red color, and quite as showy as the tropical varieties.

Nymphaea Aurora.—In their early stages, the flowers of this remarkable variety are of a beautiful copper-yellow color, similar to the rose "Beauty of Glazenwood," and later they change to deep orange-red.

Nymphaea Pygmaea.—From Siberia and China. This is the smallest-flowered species in cultivation, with white lemon-scented blossoms about the size of a silver half-dollar.

NO PERMANENT DESERTS.

Geological investigations prove that arid deserts are not permanent features of the earth's surface. The most level expanses have once formed part of the ocean bed, or great inland seas. The changes that have cut off these seas and created inland drainage areas, probably at the same time modified the rainfall of the locality. Excessive evaporation dried up the great lakes, leaving at present a series of receiving rivers that dwindle down by evaporation as they flow.

VALUE OF IRRIGATION.

The Louisiana and Texas rice industry affords practical illustration, on a large scale, of the results of irrigated farming. Acording to Secretary Wilson, the product increased from 179,919,293 pounds, in 1899, to 869,426,800 pounds in 1904. In 1899 Texas had 178 acres of rice; in 1904 it had 376,500 acres. All this is the result of artificial irrigation; the water being sometimes carried long distances in flumes.

Customer—Do you raise roses this season of the year?

Florist—This is just the season when we do raise 'em. We've just put them up to $4 a dozen.

DELICATA SQUASH

FLESH I TENDE AND SWEET

A Farmers' Movement.—In the Eighth Congressional District, in this state, a well-defined movement is quietly on foot to send a practical farmer and orchardist to Congress at the next election. The orange growers realize if they ever get any redress from the extortion of transportation companies, express companies and other public carriers, they must get that redress through the Congress of the United States.

They have borne the burden of high tariff so long, in the face of promises of relief, which have never materialized, that now they are in a frame of mind to endorse procrastination no longer.

The meeting of citrus growers. in Los Angeles, about three weeks ago, at which resolutions were passed endorsing the Freight Rate bill now before Congress, brought out a well-defined sentiment among the members, expressed privately, that the time is ripe for a general "shake up" of California Representation in Congress, to the end that a delegation may be secured which will have the interests of the farmers and fruit growers of the state at heart, and from whom prompt, aggressive action will be expected in the matter of relief from excessive freight rates on the commodities we produce.

One thing is certain, if the farmers do not look after their own interests, no one will do so for them. If they do not unite to protect themselves no one is going to volunteer to do so, hence it can not be wondered at that intelligent men, agriculturists of pronounced character and well-defined ideas of what their rights are, should be ready to combine in an effort to better their condition by electing men to serve them, in the Congress of the United States, who are with them on questions where their profits lay.

In some of the states of the middle west the farmers are uniting in a determined fight against the railroad and Standard Oil representatives in Congress, party ties are being obliterated, as such, and men are being sought who represent the agriculturists and cattle men and producers generally, There is coming a day, and it isn't far away, when the Congress of the United States must stand more for the people, the common people, and legislate in their interest, and less in the interest of the classes, or political parties as they exist in the present time will be wiped from the country. The masses are tired to death of the Senate of the United States. It has come to be a "gentleman's club," filled with nabobs, so far removed from the common people that it is regarded as an affront, by many of its members, to suggest even legislation which will better the condition of the toilers of the nation. The country isn't going to endure this fleecyism much longer. There is a well-defined sentiment already, throughout the nation, to call state conventions to pass resolutions for constitutional amendment doing away with that body. And if the present rate bill meets its death, or is rendered inoperative by reason of amendments made to it by the railroad representatives in the Senate, the indignation of the country will be at such height that the Senate obliteration order will become a most formidable measure.

So we are not at all surprised to learn that the people have begun to talk of a change of Congressmen in California. The idea is gaining strength, and we wonder not at the report which comes from Washington that there is uneasiness all along the line in the minds of those who represent the state in Congress. It is high time there should be getting down to the grass roots. The people are demanding it.

* * *

Will Congress Intervene?—Unfortunate indeed is the situation in the coal regions of the Middle West and the East. Negotations between the miners and the operators have been broken off, more than half a million men are idle and the ultimatum of higher wages or a long-continued strike has been made the war cry of the strikers.

The word has gone out that the supply of coal will barely last six months, and at the end of that period nearly all the great manufacturing plants of the country will have to suspend operations. It will readily be seen that industrial paralysis confronts the country unless the situation can be changed within the period named. With half a million men idle in the mines and three times that number idle in the industrial plants throughout the land, we shall see such a situation of hard times as we have not encountered in the last quarter of a century. With the shops and manufactories idle, the railroads impotent to haul cars, agricultural expansion curtailed by reason of inability to transport products to the markets, the outlook is clouded and dark. Both sides of the controversy have declared their resources at an end and the operators now say the only alternative is for Congress and the President to intervene and try and effect a compromise.

It is to be hoped the effort will be made and that it will be successful. So much is at issue, the ends justify almost any expediency to settle the difficulty.

* * *

The State Agricultural Society.—It seems again that discontent reigns in the management of the State Agricultural Society. Last week the Secretary was removed on the plea that a promotor is needed in that office. We are not interested in the controversy which exists in the Agricultural Society only as it affects the fair, we care nothing about the political complications existing except as they may have a bearing on the general results of the work of the Society. But it seems, the Society is dominated by politics more than by business, and this fact is disgusting the agriculturists of the state. There is a sentiment of hostility growing among the people to the methods heretofore employed in conducting the Annual State Exhibit. It savors too much of locality, they say, and not enough attention is paid to parts of the state laying remote from Sacramento. Whatever of merit rests in these complaints should be taken up and removed. The greatest good to the greatest number should be the aim of the management. If we are going to have a State Fair at all, let it be for the whole state—not for any particular section.

The date for holding the next State Fair has been fixed for August 25 to September 1 inclusive.

* * *

Fruit Exchanges Control Contracts.—A case of universal interest to fruit growers, members of an exchange has just been decided by the Superior Court of Los Angeles county. Last year Mrs. Williams, of Ontario, made a contract to dispose of her orange crop to the Pomona Fruit Exchange, thereby becoming a member of the exchange and being bound by its rules. Mrs Williams, it is alleged, sold her crop to outside parties, and the Pomona Exchange brought suit to recover 50c a box on all fruit sold, in accordance with the contract. The court awarded judgment against the defendant for the amount asked.

* * *

Buy the Best Seed.—The season is at hand when nearly every family will receive its usual supply of seed catalogs. Some will come from old reliable houses, while others are anything but reliable, thus making it difficult for the amateur gardener to select his seed, with the assurance that he is getting what he sends for. No matter how small the order, it should go to a thoroughly reliable seedsman, whose seed are sure to grow, under favorable conditions.

* * *

San Dimas Citrus Nurseries

Orange and Lemon Trees

Are the only kind of nursery stock we have grown for the past twenty years, and being the largest producers in the world we feel that we are in a position to render intending planters better service in the way of superior trees over all competitors. Our prices are right, considering quality.

Good Trees mean Good Profits

A poor tree is expensive as a gift, and an untrue-to-name plant an aggravation and waste of time, labor and money. When you plant an orange grove remember Davy Crocket's advice, "Be sure you are right, then go ahead."

We stand ready to prove to you that you will be right when planting our trees. Correspondence a pleasure, and our booklet on Citrus Culture is free.

R. M. Teague
PROPRIETOR
SAN DIMAS
CALIFORNIA.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

Congress has been petitioned to provide $10,000 with which to fight pear blight in California.

Work on the Vacaville cannery will commence at once and the establishment will be ready to handle a goodly share of this season's crop of fruits and tomatoes.

The United Citrus Association paid to its members last week $3,058.71 as second payment on the February pool, making an average on all grades of navels of $2.24 per hundred for the month of February.

Observers about Monrovia have noted that the orange blossoms were not much opened during the recent storm. This fact supports the belief that the coming season's crop has not been damaged by the washing away of the pollen, as happened in the storm of a year ago.

There seems to be no limit to the price of good oranges in the East. On Saturday of last week one grower at Redlands was offered $8,000 for his crop of late Valencias on six and one-half acres, which he refused. Navels are being sold at from $2 to $2.60 per one hundred pounds.

George H. Cutter, Horticultural Commissioner for Sacramento County, reports that the recent rain did great injury to the fruit crop of that valley, especially to peaches. Mr. Cutter believes that the outlook for pears is fairly good, and that cherries will be fine, with fair prospects for plums, grapes and other varieties.

The Pomona Times tells of a temporary laboratory fitted up at Whittier for the purpose of finding a remedy for the walnut blight. Professor Ralph E. Smith of the department of plant pathology and an assistant, under the auspices of the State University College of Agriculture, are to be in charge.

The apricot crop in the Ventura County district has been damaged to such an extent that at least one-fourth of the crop will be ruined. The immediate cause is the cold wet weather which has caused the little cots forming on the trees to rot under the partial protection of the tiny leaves of the blossom. There is danger that this condition will be felt in the apricot sections generally causing a short crop.

C. M. Gifford of San Diego writes the Fallbrook Review that he has just finished the largest pack of canned olives in the history of his factory, and Ackerman & Tuffley of San Diego, packers of the "Old Mission" brand, write that the canning of olives has proved a veritable godsend to the growers, as large quantities of canned olives are being shipped East. San Diego County is one of the leading olive growing section of California.

The California Cannery Company at Fresno has announced itself prepared to sign contracts for the next 3 years on a basis of 3¼ cents, and is preparing to erect new and large packing houses at every shipping point in the valley. Some of the executive officers of the company are expected in Fresno this week to decide definitely upon the locations for these plants. And to make matters still more interesting, a circular has been issued announcing its ability to handle the raisin crop of the state.

Secretary G. N. Whitaker of the Sonoma County Horticultural Commission advises all fruit growers to give their trees a good shaking at the present time to throw off the canker worms and to protect the trees with tanglefoot. In this way and by spraying later he is confident there will be a much cleaner lot of fruit this year than for some time past, while several years of such treatment, he says, will result in a general cleansing of the orchards, which will redound to the financial benefit of the growers many times over.

AGRICULTURE.

The value of farm products, per capita, of California is greater than that of any state in the Union.

Last year a firm at Exeter realized a net profit of $5,000 from 35 acres of canteloupes grown near that town.

The agricultural experiment station at Berkeley has just issued a bulletin, No. 175, treating on tomato diseases in California.

The gardeners of Whittier have planted 300 acres to cabbages, which at the present price of $30 per ton will net gross returns about $72,000.

The abundance of rain and the cloudy days are turning the grain yellow in the country around Colusa. Two thousand acres of irrigated land are to be sown to alfalfa seed.

On Bouldin Island below Stockton there is located the largest asparagus bed in the world. It contains 3,000 acres and an average of 325 carloads of the canned product is shipped from there each year.

The Submarine of Coachella declares that "never before in the history of the valley has so plentiful a supply of vegetables fresh from local gardens been procurable. Until this year all vegetables were shipped in, just as hay was imported up to two years ago—without reason 'tis true, nor cause other than that our people were too busy with other matters to go in for an eenty-teenty truck patch. Today we find at the meat market fresh beets, carrots, radishes, turnips, cabbage, onions celery, etc., and our folks have all had so much fine lettuce for the last month that they have palled upon it."

LIVE STOCK.

The Plumas County ordinance taxing sheep ten cents a head has been declared invalid by the State supreme court.

Cattle and hogs are going forward to market now on nearly every train, says the Imperial Press. Several car loads of hogs and some of cattle went out during the past week.

Last year the Utah condensed milk factory in Cache Valley did a very satisfactory business. The gross receipts were over $200,000 of which $104,000 was paid to the farmers for milk and $30,000 was paid out in salaries.

The Iowa legislature has passed a bill in effect requiring hens to lay eggs of a certain weight. The bill specifies that eggs on the market must come up to a certain standard. It is charged that the dealers sift their eggs, selling large ones at fancy prices and working off smaller ones upon poorer purchasers. The idea of the bill is to remedy this injustice and give housewives what they are paying for.

The Alta Advocate is enthusiastic over the high grade horses being raised in Tulare County. In a recent issue it says: The horses that come to Dinuba from the country are above the average. Some of the specimens of equine beauty in the state are on our streets daily. The sturdy draft horse, the bright-eyed, clean-limbed racer and the practical and all purpose horse are among them. Good trotters and all around roadsters are in the list. And this year the young stallions that are in the Alta district are numerous. Many of them are imported and high priced, and we may look yearly for an increase in our breeds.

MISCELLANEOUS.

It is understood that the S. P. will soon commence the erection of a depot at Thermal.

The largest English walnut orchard in the United States, comprising nearly 1,000 acres, is in California.

California has some of the largest seed farms in the United States and furnishes about one-half the world's supply.

The Holtville brick plant is working to its fullest capacity at the present time and is now burning a kiln of 275,000 bricks.

The rainfall at Squirrel Inn for the present season to date, says the San Bernardino Sun, is 54.70 inches or almost five feet of water.

There are single fields of wheat or barley in California larger than the entire acreage to those products in the six New England States.

The Merchants' Association of Anaheim has requested the City Council to pass an ordinance excluding peddlers and fakirs from the city.

Henry Miller, the wealthy cattleman, has signified his intention of building an immense Sanitarium near Gilroy. It will cost about $100,000.

The Ukiah Times estimates the loss of the boundary line case at $100,000 for Mendocino county. It is all a grazing country, worth from $3 to $10 an acre.

The latest estimates place the damage of the rain flood in San Diego county at over $100,000. The damage to the streets of San Diego is estimated at about $12,000.

The Redlands Board of Trade has asked the San Bernardino County Supervisors to make an appropriation for forestry work to supplement that done by the government.

Japs in Pasadena have recently been killing many meadow larks mockingbirds, and other birds of song and plumage, to be eaten. The practice should be stopped.

Throughout the Middle West States reports are in existence that the Western Pacific Railroad wants 10,000 laborers to build its roadbed between Salt Lake City and San Francisco.

The United States Department of Agriculture has sent two men into Yolo County to investigate the methods employed by water users in that county.

Hardy Presswood of Guerneville jumped into Russian River one night last week and was drowned before the eyes of his brother and Deputy Sheriff Robert Garner.

A movement is on foot in Pasadena, under the direction of the Emergency League and Opportunity Club, to establish a permanent home for the treatment of tuberculosis victims who may come to Pasadena.

The Messenger says the almost unprecedented fall of rain in the vicinity of Highland brought ruin to some of the small orange groves which lie near the mouth of the mountain canyons, and will result in financial loss to the owners of those groves.

Live Stock and the Dairy

BY MRS. MINNA E. SHERMAN, FRESNO, CAL.

SILOS.

The desirability of silos in California is best known to the dairyman. Others are apt to think that having no cold winter there can be no need to store food; but I have found from personal experience that we have August to the time that grass grows green and strong when there is an interval that nothing fills so well as silage. This period often lasts several months and the cows shrink in milk from want of succulent food. It is expensive to grow corn and cut it before it reaches its best to feed green to cattle. A crew of men and a cutter put the corn into the silo with economy, for it is then under the constant supervision of a foreman; while, if a couple of men are sent away down the field to cut corn for the cows they listen to the birds sing or talk politics—when the forty or fifty minutes wasted on each load comes to be counted up, it is found that the silage costs too much money. The time paid for is added to the expense account and is an absolute loss, as it cannot be picked up again. If I could only convince all the farmers that the time of men is money, and that without work being under constant supervision the labor expense on everything eats quickly into the profits I would confer on them a great boon. I have seen men who handle themselves so well they are cheaper at $40 a month than others at $30. The money invested in good men is well invested, as also is the money invested in a good silo.

The Modern Silo.

* * *

On the tenant farms of England and of Germany, where the tenant loses his improvements at the end of the term of his lease, a modified form of silo, a stack silo, has taken the place of the building. A heavy timber is laid on the ground and on it the stack is built up as solidly as possible; after it is up a rope is passed around the bottom and then six scantlings are stood up on end; at the top these are again tied with a heavy rope and now the irregularities are cut from the side and piled on top and tramped in. At the top a slat roof is nailed together of six-inch boards to heavy beams, across this is placed a heavy timber, lying loose or unnailed, and from this heavy wires or chains hang to the ground. Into the loops of this chain the end of another timber is passed and the short end of this is fastened to a clevis driven into the timber under the stack; the long end of the lever is weighted heavily, both sides of the stack are fixed with this leverage and the pressure is continuous. The foreign authorities claim that there is only ten per cent of waste in the stack, but in Wisconsin, at the experiment station, it is claimed that there was nearly thirty-five per cent of loss.

I have only tried this form of packing with green sorghum and then I had between every two feet of sorghum six inches of short wheat straw and stack waste. It was in the field and the cattle were allowed to eat at one end of it while they were fenced away from the others. The waste could not be counted, but it was eaten clean, but then the youngsters will eat everything dry when the grass is very young; they are so glad to have something that does not make their mouth so tender or set their teeth on edge.

The first silo built at the ranch is sixteen feet by thirty-two and has been in use fourteen years. It has not had any repair to date, but I think will have to be relined next season. This silo stands on a brick foundation, six bricks deep and two wide; the bricks are laid in Portland cement and are placed in a trench ten inches below the surface, the earth removed from the trench being banked against it so as to make it lower in the center; this relieves a little of the strain of the walls. The corners of the two square pits of this silo are cut across by putting a timber across them and the lining is inside of this; two of the corners, one in each pit, are left enough larger to make chutes for the silage to be thrown down into the wagons.

* * *

As the details other than those given here are the same as the round silo, and as that is the best form, we will pass on to that in the description of the building. After the circular brick wall is completed it remains a matter of local conditions as to whether the silo has a cement floor or not. On well drained soil where rats do not abound, there seems to be no need of having one, at least I have not found that one was needed in either of my silos. If one is used it should be placed above the surface soil by filling for it and a tile drain laid under it to carry off the surplus water that will collect from the silage. The silos are cut from two by eights and are angled to fit them to the top of the bricks, but not shaped to the curve. These are set into and also to the upright scantling, toenailed after made level by bedding them in mortar. In a silo thirty-five feet in diameter the studdings are two by fours; these are sixteen feet long and are lapped to nail two and a half feet. This makes the silo about thirty feet to the plates. The plates are cut like the sills and, indeed, it is well to cut them all at the same time. After the studding are up and plumb they are nailed to the sills and rough six inches wide, half-inch thick boards are nailed around and around until the top is reached. This lumber must be of uniform width and fitted closely together; heavy tarred paper is then placed over it, lapping all joints, then another layer of these boards, then more tarred paper and the tongue and grooved narrow board planned on one side. If the first rough lumber has the first boards split lengthways to half the regular width, then the next regular width, when the second lining comes to be put on the joints are sure to be broken. The outside of the studding is now covered with house rustic around and around. At the top and bottom of this rustic, holes are bored between each studding to let in the air to dry out any moisture that might accumulate. The roof has a dormer window through which to fill the silo. When the first lining boards are being placed in the silo, when they reach the heights desired for the first door, the studdings are cut and the pieces removed are nailed at the top and bottom of the windows; the lining boards are carried across the opening only they are nailed carefully along the length of the top and bottom; after the lining is finished the three thicknesses are sawed through and the door is hinged. The lining is hung so as to open inward and the one in the rustic opens outwardly. When the silo is being filled, as soon as the doors are reached the outside is fastened and the cracks are covered with tarred paper and then the inner one is closed and two thicknesses of tarred paper is nailed over the opening or cracks.

It is a little hard to calculate the number of feet of silage the round silo holds, but the following tonnage is usually accepted as correct: A round silo, twenty feet in diameter and fifteen feet deep, will hold fifty-nine tons; while a silo thirty-two feet deep and twenty-six feet in diameter will hold three hundred and forty-six tons of silage. With size, the compression of that at the bottom is so

"CHEAPEST" AND "BEST" CREAM SEPARATORS

More truly is the best the cheapest in the purchase of a cream separator than in the purchase of any other farm machine. The really cheap cream separator is the one which will perform your work in the most profitable and satisfactory manner, and last the greatest number of years. Basing the value of the separator upon durability, without considering quality of work, if it lasts but two years it is worth only one-fifth of what the separator is that lasts ten years, and one-tenth of what the one is that lasts twenty years. In addition, if it loses a large percentage of cream and is difficult and expensive to operate its value is placed at even a still lower level. **DE LAVAL** cream separators are today admitted by every experienced user to do as near perfect work as a cream separator possibly can. Proof of this is seen in the fact that over 98 per cent of the world's creameries and all largest users employ the **DE LAVAL** exclusively. As to durability, the **DE LAVAL** has an average life of twenty years. The very best of other separators do not last over eight or ten years at the very longest, and the poorest generally become worthless in from six months to two years. At the same time these machines are incapable of doing perfect work except under ideal conditions, such as cannot possibly be had in farm use—otherwise they lose a large percentage of the cream, are hard to operate, and in reality are but little better than gravity setting systems. It is therefore seen how little the first cost of a cream separator really means. The cost in the end is what counts. All in all considering dollar for dollar value, a **DE LAVAL** machine gives from five to ten times more true separator worth than any other machine on the market today. These are not mere paper claims but facts, proof of which can be had for the asking.

much greater that the weight increases rapidly.

Now as to cost: It varies all the way from $1 to $2.50 a ton capacity, and the only way to reach it is to make up the bill of lumber and find what it costs at your home. Then it also depends upon whether union wages have to be paid or if there are job carpenters in the neighborhood that work cheaper. The stave silo is good form and many are being built, but then they must be carefully looked after when empty. Those at Dos Pelos are now being used for three years. In the East they are usually built inside of the barns so that they are not exposed to the direct rays of the sun. Stone, brick and groute silos are all bulit. but except in some favored parts of the state the wooden silo is the cheapest.

The standard book on silo building is by F. W. Woll, professor at Wisconsin University, and is published by Rand, McNally Co., Chicago. There is also a brief bulletin published by the Department of Agriculture at Washington. If you are going to build in California it is well to submit the bill of lumber to some city lumber dealer and have the material sent in to you in carload lots of the proper lengths. Whenever it does not come out an even carload of building stuff I have either bridge planks or Redwood stakes. The neighbors are glad to buy any you may not need as they are cheaper than the local rates.

Economic buying is money saved every time and where there is not co-operation among the neighbors it pays to co-operate all alone with yourself against local exactions. The city wholesale man is always glad to recognize the cash buyer in the country.

HOW TO MANAGE A HERD OF DISEASED COWS.

The tuberculin test is very reliable—that is to say, that in a large percentage of cases. when the proper precautions are taken and good, fresh tuberculin in correct quantity is used, and no errors are made in the readings of the thermometers, it indicates the animals that are free and those that are tuberculous; but it does not give any hint as to the degree to which the disease exists in those that react. For instance, two animals may show practically the same temperatures, yet on post mortem one may show only a few small growths, while the other is generally affected and in some parts large masses of growths are discovered.

As to whether it is wise to kill all that react, if you refer to general practice, I answer emphatically, no. There are in certain herds circumstances that warrant this—e. g., if a man has fifty head and five react, and there is no special reason to demand the saving of one or more highly valuable animals on account of their breeding value, it would often be wise to clean out the five and use for beef any not physically bad. This would rid the herd of the animals believed to be infected; then it would be necessary to disinfect as thoroughly as practicable, look out for new cases and retest the herd in about nine months.

On the other hand, if one has a herd of fifty head and thirty or more react, it will as a rule be found that the great majority of diseased animals are the working factors in the herd (the mature cows), while the non-reacting animals are mostly calves and yearlings. Thus if all that react are killed, the dairy products are nearly or entirely cut off, and all that are left will be a bill of expense for some months and more or less for two years. In such cases as this, it behooves the owner to weigh well all the facts and conditions that surround him. If the herd is a good one, even grades or common cows, he can kill from time to time any that run down and that are physically bad; separate the healthy from the diseased, putting the non-affected in new quarters; feed calves only on milk from the latter, and take calves from infected cows as soon as born to the quarters where non-infected animals are kept. Animals that are fit for beef could be killed, and the proceeds spent in the purchase of new cows, which should be bought subject to the tuberculin test, etc. In this way business can go on and a new herd be built up.

In New York state for some years prior to 1899, when I took my stand against the then universal opinion that bovine and human tuberculosis were identical, the law demanded that all reacting cattle be killed, but since that time the most violent advocates of that method have been obliged to modify their views, inasmuch as it was pointed out that the indiscriminate slaughter of all known tuberculous cattle was a proceeling born of ignorance, its provisions were not possible of attainment, and its advocates were unable to show, after several years of wholesale slaughter at the cost of millions of dollars, that they had accomplished anything whatever. Nor could they point to a single county or state that had been freed of bovine tuberculosis. We cannot stop rivers running to the sea, but we may guide them and control them to be a considerable degree.—Dr. Edward Moore in Country Gentlemen.

ALFALFA PASTURE.

California Cultivator—I have about 1500 pigs and hogs on 100 acres alfalfa and I want to ask a question. Will it hurt alfalfa when there is a fine stand, to keep it eaten down with hogs the year around, or should it be allowed to head and cut for hay?

W. B., Holtville.

It is not best for your alfalfa fields **to keep them eaten clean down to the roots by hogs.** Alfalfa is much like clover, it needs to rest and to be allowed to gather strength. Better fence off the 100 acres into 40-acre pastures and run the hogs in one 40 at a time, giving the alfalfa time to rest and to strengthen. So large a bunch of hogs running continuously on your alfalfa will be apt to injure it in time.

FEEDING THE COW.

Editor Cultivator: Will you please inform me as to feeding a cow for butter. I am a novice in feeding and have a fine Jersey cow and would like to try her out.

Feed plenty of alfalfa hay, bran and shorts, in the proportion of two to one, twice a day, about four quarts to a feed, salt once a week. Feed, water and milk at regular hours. Be gentle when handling your cow and she will well repay your kindness.

The U. S. Department of Agriculture estimates the number of milch cows in the United States on January 1, 1906, at 19,793,866. Of these California is credited with 390,015.

The reports obtained show that California made in 1905 the large quantity of 42,000,000 pounds of butter.

One of the best ways to wash milk utensils is with tepid warm water in which a little soda has been dissolved, then apply scalding hot water, rinse dry and give a good sun bath.

RECORDS OF DAIRY COWS.

No one thing connected with dairying has received more attention recently than that of ascertaining what dairy cows give in return for their food and care. The carefully kept records of experiment stations and the records of hundreds of the most successful dairymen have proven that milch cows vary even more in the amount of return they give for the food they consume than had been claimed by the advocates of special-purpose dairy cows. There has been a great advance made in keeping records of the yield of each cow in a herd to the great financial benefit of those who keep such records.

A man looking for a profitable cow should always keep in mind the fact that it takes from one-third to one-half of all the feed a cow eats to maintain her body, and if there is a surplus amount of body to maintain the profits will be correspondingly less. This does not imply that the small cows should be selected, but that those with small udders and large bodies are not, as a rule, good milk producers.—The Ranch.

Skim milk and buttermilk have about the same feeding value. It has more value for growing hogs than it does for fat production. Feed one pound of grain to three or four pounds of skim or buttermilk to growing hogs.

Cures the sick and acts as a preventive for others, and is given on the teeth and tongue. Safe for Brood Mares and Colts and all others. $1 00 per box, ½ doz. $5.00. Sold by druggists, or sent express paid.

Paxton Veterinary Medicine Co., Box 95, Sta. C. Los Angeles, Cal

TUBULAR--or "Back Breaker?"

When you see the waist low Tubular you can't be driven into buying a back-breaking, "bucket bowl" separator. **Can and crank are just the right height on the Tubular.** Here is the largest Dairy Tubular along side four "back breakers." The girl with her hand on the Tubular is 5 feet, 4 inches tall. This is an exact reproduction from a photograph. **Which kind for you?** Makers of "back breakers" try to get their cans low by setting the cranks low. **High cans** break your back backward—**low cranks** break it forward. Unless you are a double jointed giant, you'll find a high can is no joke. To show you how high these "back breaker" cans really are, when the machines are set high enough to turn easily, we raised these "back breakers" 'til their crank axles were level with the Tubular crank axle. "Back breaker" makers don't like this picture—**it's too true.** They try to squirm out of it. **You wouldn't like turning cranks as low as "back breaker" makers put them.**

The low can is only one of many advantages Dairy Tubulars have over all others. Dairy Tubular bowls are simple--"back breakers" are complicated. Tubulars are self-oiling--no oil holes to fill up. "Back breakers" are oil drippers and oil wasters. To learn a lot more about Tubulars, write today for catalog N-260

Profit in the Poultry Yard

BY MRS. A. BASLEY, HOLLYWOOD, CAL.

QUESTIONS AT THE FARMERS' INSTITUTES.

I have been out at the Farmers' Institutes during the past week, and besides talking on my favorite subject of poultry, (I really have been a poultry crank all my life), I have been greatly interested in hearing others talk on the subjects of the greatest moment to farmers, and in fact to the whole nation.

It is by learning of the discoveries of others, by hearing of the experiments. of the analysis of soils, by comparing the old and the new way of farming in all branches of the work, that improvements are made. We can take what we hear at these institutes and use the knowledge thus gained to benefit ourselves, use other people's brains and other people's experiments to save our own.

"Experience teaches," but her lessons are very costly, and these institutes at which we are taught from the experiences and experiments of others, will save us many, many dollars; will make our work more and more interesting; will teach us the best and cheapest way of getting the finest results, keeping us up-to-date and a-breast of the times.

In traveling to these institutes I have been greatly pleased to see on many of the ranches, beautiful flocks of fowls well cared for and in good healthy condition. The improvement in these flocks is very marked and the henneries, brooder houses and appliances all show signs of thrift and prosperity very pleasing to note.

After each paper questions are asked and the topic is thoroughly discussed.

The questions at the recent institute were often very interesting. Trap nests and how to manage them, how many trap nests would be required in a flock, and many such questions. The answer to this was that one trap nest to three hens is quite sufficient. With this number the nests need only be visited twice in the morning.

Among other questions are the following:

First—Is it your opinion that the Leghorn breeds are more apt to catch cold and more affected in egg production, by stormy weather than other varieties? No, the Leghorns are quite as healthy as any variety, but all fowls feel a change in the weather, and when chilly or rainy weather comes suddenly, the egg basket quickly shows the effect. If I only have a few fowls to offset the chilly rain I give them a warm supper and add a little pepper to it.

Second—Are White Leghorns more delicate than the other varieties of Leghorns? No. They are just as hardy as any, but the offspring of any ickly hens, or hens that have had croup or any serious malady, have weak constitutions and are very apt to be taken ill just at the same time of year in which their parents were ill. All varieties of Leghorns are equally hardy and all are good layers. Some people prefer the brown or lack, because they think hawks and other marauders do not see them as quickly as the white fowls. Peronally, I have not found this to be he case.

Third—Do you consider Barred Rocks or Orpingtons better winter ayers than Leghorns? If the weather is cold the Rocks and Orpingtons lay better, but early hatched Leghorn pullets. properly fed, canot be surpassed as layers. In the econd year the Plymouth Rocks will outlay the Leghorns.

Fourth—Which would you recommend as as all-round utility fowls, the Barred Rocks or the Buff Orpington? They both belong to the "utility" reeds. They are both good winter ayers, if properly fed, and I should ecommend you to raise whichever reed you like the best. Choosing ggs for hatching from parents that re good winter and fall layers, and he following year keeping the eggs rom hens that laid early and well in their pullet year.

Close culling and careful selection, choosing only the eggs from the very best are the rules for building up a flock of fine layers.

All the Orpingtons have the white meat and skin, the Buffs and White have pinkish white shanks. The Orpingtons are a little larger than our American breeds. They lay brown eggs like Plymouth Rocks in size, hape and color.

Whatever breed you decide to eep, keep only that and learn that reed. Study its characteristics, find out and rectify its defects, encourage nd develop its good qualities There is no possible way to judge of the intelligence and disposition o birds, save by our personal experience ith them," are the words of a bird over. Gene Stratton Porter.

tual confidence and make them tame, and tame hens will be much more profitable than wild, nervous, unsociable hens.

A flock of pure blood fowls, all alike in shape and color, is a beautiful sight. When I was at San Jacinto last week I was much delighted with Mr. O. S. Hoffman's plant of Buff Wyandottes. He took many prizes at our Los Angeles poultry show and it was a pleasure to me to see his twelve pens of beautiful buff breeders. on the green alfalfa; every pen alike, every house like its neighbor; all built on a sanitary plan, so that there are no sick chickens. His youngsters are pictures of vigor and activity. I have asked him to give me the size and plans of his houses for they are inexpensive and very satisfactory. He kindly promised to let me have them for the use of our readers. What impressed me on Mr. Hoffman's place was, not only the beauty and vigor of his fowls, but the almost military precision of the arrangement of his houses and pens. All in line, all exactly alike. He is handy with tools, makes his own hoppers, is using the dry feed method, with excellent results and is making a success of the poultry business.

EDITOR'S QUESTION BOX.

Feeding. (A. B., Santa Ana.) In a recent issue you refer to the necessity of feeding different breeds, different rations. Will you kindly state what you consider a proper ration for Leghorns; also for Plymouth Rocks. Both having a free alfalfa range.

Do you consider a chicken can be fed for $1 or $1.25 per year at the price of grain in this country?

Do you think it advisable to force the chickens to moult all about the same time, so if possible, to start them laying as soon as possible?

Answer.—Leghorns being light, active, nervous fowls do best when they can have food which is so balanced as to give them more heat, energy and fat than the American breeds require. Consequently it has been proved that a wide ration of the nutritive value of 1.5 or even 1.6, will promote egg-laying among them.

With a ration as wide as that, the tendency of Plymouth Rocks would be for the surplus food to turn into fat instead of eggs, therefore the ration of 1.4 for them gives the best results.

I do not know what your cheapest available foods are, but if you consult the Farmers Bulletin, 164, on poultry feeding, (write to the University of California, Berkeley, for it), you will see the nutritive value of all the foods and can balance your rations perfectly.

A hen can be fed for $1.25 in Los Angeles, per year. I myself did this.

I do not think it advisable to have all the hens moult at the same time, because I want eggs, and fertile eggs all through the season. I found it best to assist the moult and have an early moult with part of my flock.

* * *

Water Glass. (H. K., Corning.) Will you tell me how much water it takes to the gallon of water to keep eggs? What temperature should they be? Will eggs preserved in water glass keep and sell as well as if they are in cases and cold storage? What sort of barrel is best? Will whisky or molasses barrels do?

Should the little or big end of the egg lie up?

PRACTICAL INCUBATORS positively the best. Hatches more and stronger chicks. 10 YEARS' GUARANTEE

Cat. free. PRACTICAL INC. CO., 720 S. 11th St. San Jose, Cal.

Why do you pay $5.00 to $8.00 per hundred for eggs for hatching when you can get just as good eggs from just as good stock from us at one half that price? Our stock is large and healthy. The hens lay lots of large white eggs that run as high as 98% fertility. We sell eggs in incuator lots only at $2.50 per hundred.

Avenue Poultry Yards, Ventura, Cal.

Answer.—Water-glass, called silicate of soda, can be purchased at the Sun drug stores in Los Angeles for 85 cents a gallon, or by the five-gallons for 65 cents.

It can be bought at the Owl drug stores here and in San Francisco for $1 a gallon or for 80 cents per gallon in ten-gallon lots.

You put one gallon of the silicate of soda into ten gallons of water that has been boiled and cooled—or one pint into ten pints.

The temperature should not be above 65. A cellar is a good place.

The eggs must be kept two inches under the water by a board with a stone on it.

If you use a barrel have it quite clean, scalded out, or charred.

The eggs can be washed in pure water after they come out of the water-glass. They will keep good a year if they are quite fresh when put in. If you put in a few bad eggs they will spoil the whole lot.

Preserving eggs in water-glass is the best and cheapest way. One gallon will preserve fifty or sixty dozen.

* * *

Indian Runners. (N. E. M., Santa Ana.) I had an Indian Runner duck that got a hole in her crop, size of a half-dollar. It lived for a week in that condition. Do you know the cause and can you give a remedy for such ailments? Another duck in the flock has ruffled feathers and has not grown as large as others. They are all 11 months old, have all laid splendidly until the past month. They have been feed cracked corn, bran, meat scraps; have sand, oyster shells, charcoal and lime, and free alfalfa range. I cannot account for the unthrifty appearance of last duck referred to, although she is as brisk in her movements as any.

Answer.—I cannot account for the hole in your Indian Runner, if it came from without it may have been cut or broken glass, barbed wire or something sharp. If it came from within a bit of partially slaked lime would do it.

Ruffled feathers may come from a chill when young, or it may be a duck with "curly hair." Probably next moult will correct this.

HATS OFF TO LADY HEN.

In 1904 the state of Illinois raised over $20,000,000 worth of poultry and eggs, while a number of other Western and Southwestern states were not far behind these figures. In California the product of the hen aggregated $7,000,000, and the state imported $3,000,000 worth of eggs and poultry.

To many a rancher, chicken raising looks like a small business, yet when it is considered that the farmers' income can be greatly increased with but little additional expense, the wonder is that every farmer is not taking advantage of this profitable side issue.

Locally, merchants import eggs, and quite frequently mighty poor ones, to supply their trade; chickens are expressed here daily from the northern counties. Now eggs are often worth 40 cents a dozen, and will average 25 cents throughout the year. A chicken two-thirds grown brings 75 cents. What can the farmer grow that will bring him larger returns?—Exchange.

The poultry product of the country equals the annual wheat product. It amounted to $50,000,000 last year and without doubt directly benefited more people than any one product of the farm.

Standard Bred S. C. White Leghorns

EXTRA LARGE BIRDS AND HEAVY LAYERS. Eggs, $2 per 15; $8 per 100; $60 per 1000 from January until July only.

West Coast Chick Feed

A perfectly balanced ration for the growing chicks. All pure food, no filler, no waste, hence cheapest. Keeps them growing and healthy. Made by

WEST COAST STOCK FOOD CO.

818 San Fernando St. (through to Alameda) Los Angeles, Cal.

SAM'L R. KELLAM, President of the L. A. Co. Poultry Association, says: "West Coast Chick Feed is the best feed for young chicks I have ever used."

MRS. A. BASLEY, the celebrated poultry authority says: "I want some more of your West Coast Chick Feed for it is excellent. I is purer, cleaner and appears better balanced than other feed I have been using, and to tell you the truth I have been experimenting feeeding both together and they always eat yours in preference."

S. M BUTLER, Lamanda Park, the well known poultry judge and successful breeder, says: "I want to say that too much praise can't be given West Coast Chick Feed for growing Chicks."

MARDEN EGG FARM

HYNES, CALIFORNIA

Breeders of S. C. White Leghorns Exclusively

Fine Feathers alone do not make the profitable hen. Our fowls have the reputation of being ***extra large, handsome*** and ***extra heavy layers.*** Last season, our eggs averaged over 95 per cent. fertile. ***Remember***—In getting eggs from us, you do not get them from the general runs. We have but one grade of eggs to sell for hatching and those are from our breeding pen composed of only the choicest fowls, selected from hundreds that are ***bred to lay.*** Hens that approach the ***200 egg record.***

Price of Eggs—$1.50 per 15, $5 per 100. ***Send for Illustrated Catalogue. Address,***

LEO. W. MARDEN, Manager

LAYING HENS

We have a few choice 1½-year-old Thoroughbred White Leghorn hens, which we are offering at a sacrifice. In order to make room for our young stock we are offering these fowls at $15.00 for 12 hens and 1 rooster or $100 per 100.

We also have a number of 5-months-old pullets, also of the same variety, on which we can name you the same price. If your stock needs renewing, send in your order at once, as they are going fast.

We have a Hatchery of 50,000 chicks per month capacity, from which we are making shipments daily to all parts of the Coast. If you need any just hatched chicks have your order booked at once, so as to get them on the date desired. Our price for just hatched chicks is $7.50 per hundred f. o. b. Petaluma.

We manufacture the famous MUST HATCH INCUBATORS AND BROODERS and a complete line of poultry supplies of every description. We cater to the best hatching egg trade on the Coast.

Before purchasing write for our new illustrated Catalogue B, which contains descriptions, prices, etc., of all our goods.

Must Hatch Incubator Co., Petaluma, Cal.

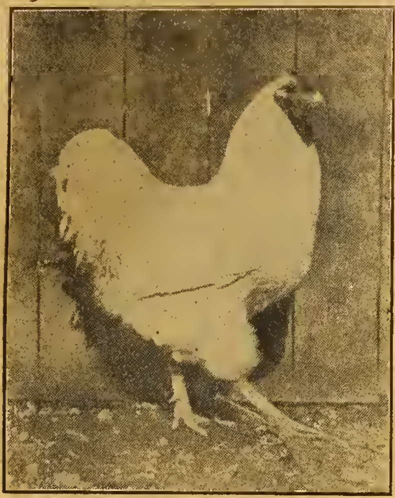
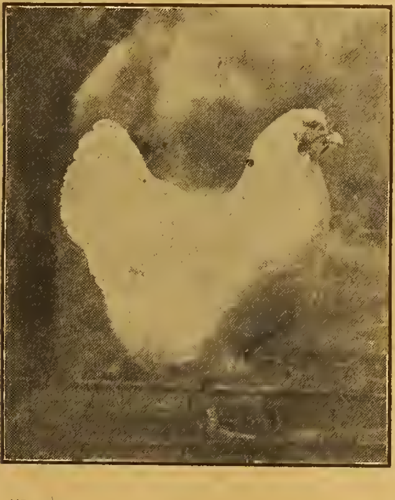
WINNERS AT SAN FRANCISCO.

We give herewith a couple of engravings of beautiful Wyandottes, which were winners of firsts at the San Francisco Show, 1905. They are the property of A. L. R. Mantz, owner of the Capitol Avenue Poultry Farm, San Jose. That these birds are beauties may be imagined from the engravings.



"Snowball," whose picture appears above, is own brother to first and second prize pullets and of some other birds in the first prize pen at the same show. This cockerel is highly valued by its owner, who is grooming him for first prize at San Francisco next year, and if any fancier sees fit to lift that prize from Mr. Mantz's grasp they will have to put up some exceptionally fine stock.



"Madam White" was the first prize hen at the San Francisco 1905 show. She is the bird of whom Judge T. E. Orr, who was Superintendent of Poultry Association, remarked. "She is the whitest bird I have ever seen in my life." She is not only a beauty in form and feather, but comes, as do all of Mr. Mantz's birds, from a strong laying strain.

A Pittsburg man claims that he can make his hens lay by the use of electricity. Next!

When hens are closely confined they should have fresh grass every day.

"Did you tell your sister like I told you to that I am worth a million?"

"Sure."

"Good boy! Here's your dollar. What did she say?"

"She said you might have a million, but you wasn't worth a million by about $999,999.70."—Houston Post.

The dying man stirred restlessly. "Be sure and and send that order for more ice, Marie," he muttered.

The watchers looked at one another and nodded comprehensively. "He's almost there," they whispered.

White Wyandotte Eggs
For hatching. Pure Dustin & Hallack strain. From 1st Pen, $3.50 per setting, 2nd pen, $2.50.

THE GRANGE IN CALIFORNIA.

Editor Cultivator: The patrons throughout the State will be glad to hear that there is a marked increase in the interest taken in the grange work. Two new granges have been added to the list; three old ones have been revived; back dues are being paid and good work is being done all over the State.

In Southern California Farmers' Fire Insurance has made a special feature of the grange. This will be a great boon to the patrons of that vicinity if the insurance problem proves successful (there isn't a doubt as to its sucess with such capable men as Bro. John Tuohy at the head of it) as Farmers Mutual Fire Insurance is and has been in Sonoma county.

Resolutions favoring Parcels Post have been sent to the Congressman from their district and a committee of patrons from the various granges in the county met with the Board of Supervisors and urged it to provide some plan for the employment of convict labor on the public highways in said county.

The Worthy Master has sent a very encouraging letter to the Patrons and the Wo[illegible] Lecturer's letter contains much good advice, which, if heeded, will make the grange work more uniform.—Emily L. Burnham.

FOUNDATION FOR HOME.

In all probability, if we could ask every family what they most desired, the ansewer would be "Happy Homes." Now the question is, how are we trying to obtain happy homes?

It has been proven beyond all doubt that money, even great riches alone, cannot make a happy home. If we study the question closely, we find it is useless to strive after happiness. Timothy says, "Godliness, with contentment, is great gain." Here we have the whole thing in a nutshell, or at least the foundation of it. Serve God first. The whole family—and bring the children up to it; not by any iron-clad rules, but make it a business to live your religion before them every day. Attend church and Sunday school. Don't make it a duty, but a blessed privilege, and enjoy it. Don't make belive, but let it be the real thing. If you don't enjoy it, search your heart and find out what't wrong. If we have Godliness and contentment, we cannot very well help being happy. It will follow as naturally as water runs down hill. Do not think that if we could have our houses furnished a little better, or felt that we could afford to extend hospitality oftener, or a thousand and one things we could bring up before our mind's eye, we might be happier. It is all a delusion.

Let us impress this fact upon our minds. It is our attitude toward our environments that effects us, not the environments themselves. Let us be contented and thankful. If we are always looking into the future for happiness, we will never have it. Let us just live one day at a time and be thankful we cannot see even one day ahead. If the rain is ruining our crops, let us deliberately put our eyes and mind on something the rain can't ruin, and enjoy that. In other words, there's a bright side to everything if we but find it; and when it happens that we cannot find it, let us blame our own stupidity and stubbornness, not an "all wise Creator."—Mrs. M. Waters.

The California Promotion Committee has issued a handbook entitled "Intensive Farming in California." It is to be hoped the handbook is really practical and not theoretical, as so many of such publications are.

"EXCELSIOR."

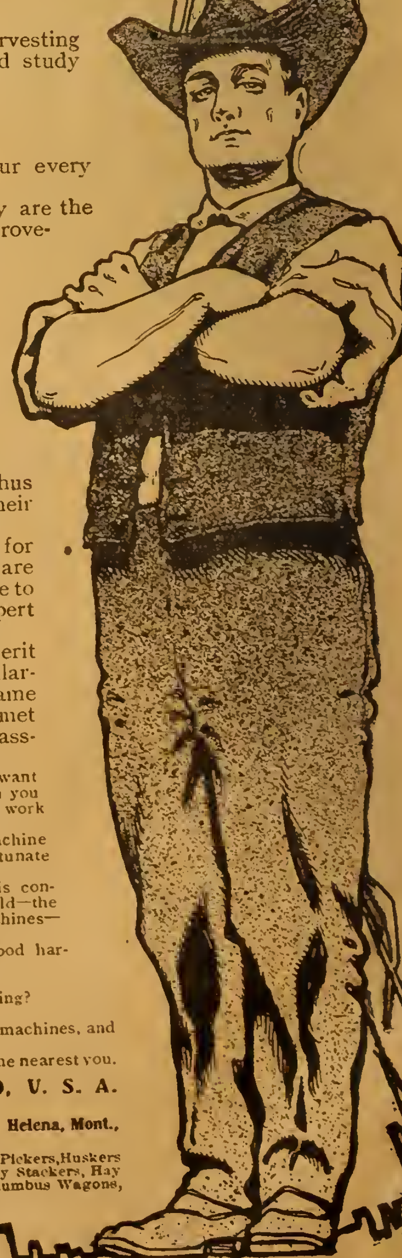
The Del Monte Milling Co. have nailed "Excelsior" to their mast and are putting out a line of "Excelsior Poultry Foods" which are claimed to be winners. Winners, because of the healthful, producing stock which is maintained when it is fed.

The company are putting out pure poultry foods. The Excelsior Chick Food is a scientifically compounded food for young chicks and sold at a most reasonable price. It is put up in packages, also in 100-lb. sacks. It is a complete food, so that only water and. possibly, green food need to be supplied.

Excelsior Egg Food, one feed a day, will shell out the eggs to the "queen's taste" and give a satisfied feeling to hen and to owner.

Besides these the company make fattening and moulting foods. Regarding them all they put out a little leaflet with illustrations of fattening coop and facts regarding poultry foods which will be of value.

James J. Hill, the great railroad man has offered prizes aggregating $7000 to promote scientific farming in Minnesota and the Dakotas.



NOW IS THE TIME!
GET A GOOD READY FOR HARVEST

You have heard of the cow that gives a big pail of milk and then at the last moment kicks over the bucket and spoils it all?

What about the man who grows a good crop of grain and then *half* harvests it?

You wouldn't *waste half* your crop.

Of course not.

But why waste *any of it?*

Why not get it *all?*

As the boys say, "Every little bit helps."

Every little bit *wasted, counts*—and counts *against* you and your profits.

As a sensible farmer, you can't afford to approach harvest time without making sure that you are ready for it the very minute that your grain is ready.

You cannot afford to depend upon a harvesting machine that wastes even a small part of your grain.

You cannot afford to spend your money for a "may-be-so" harvesting machine—one that may or may not do your work for you in a satisfactory manner

You cannot afford to start harvesting with a machine that may break down at your busiest moment.

You cannot afford to start harvesting with a machine that will half kill your horses before your grain is cut.

You cannot afford to start harvesting with a machine that is likely to cause delay in your work.

You cannot afford to take chances.

You want *to be sure*, and now is the time *to make sure.*

Go to the Nearest Dealer

Examine for yourself the line of standard harvesting and haying machines for 1906. Get a catalogue and study their construction. You will find in

Champion, Deering, McCormick,
Milwaukee, Osborne, Plano

lines harvesting and haying machines that meet your every expectation and fill your every requirement.

They are *right* in principle and design, for they are the product of a half century's inventive genius. Every improvement that the best mechanical experts of the world have been able to discover or devise in 50 years is embodied in their construction. That's why they are so convenient to handle—why they do their work so well. That explains too why they are so easy on man and horse—and why they waste so little grain

They are *right* in materials, for their manufacturers by co-operation are able to produce and select the best materials. By co-operation they are able to own, control aud operate their own lumber camps, their own iron mines, their own coal mines, their own coke furnaces, their own steel mills and other sources of raw materials, thus being sure at all times to have materials for making their machines of the highest quality.

They are *right* in workmanship, because the demand for these standard machines is so great that immense factories are necessary for their production, and their manufacturers are able to equip the factories with the best facilities and the most expert workmen?

They are *right* in reputation, for they have by their own merit survived years of strenuous competition. They gained their popularity solely on their merits. They retain their popularity in the same way. They are used all over the world solely because they have met the demands and filled the requirements of grain-growers and grass-growers.

Is not that just the machine you need for your harvest for 1906? You certainly want a machine with a reputation behind it—you cannot afford to run risks. Where can you find a machine of any kind that has a record of more years of successful, satisfactory work than you *know* these machines to have?

You want a harvesting or a haying machine made of the right materials. No machine can have *better* materials than have these machines—few manufacturers are fortunate enough to secure so good.

You want a machine that is built on the right plan—that "works right"—that is constructed on the right principle. The approval of the grain growers of the whole world—the successful standing of the test of years—the ever increasing popularity of these machines—these things tell the story of how they are built and how they work.

In reputation, in workmanship, in materials, in design—in all that goes to make good harvesting and haying machines they are *right*. They will meet your every requirement.

Can you afford then to go into the harvest with a machine that may fail you?

Can you afford to run the risk of a "break down" at a critical stage of your harvesting?

Can you afford to waste a part—even a small part—of your grain or grass?

Don't do it but go to the International dealer, secure a catalog, inspect these machines, and "get a good ready for harvest."

If you don't know an International dealer—write to us for the name and address of one nearest you.

Queries and Replies

CATALPA SPECIOSA.

Editor Cultivator: Please inform me how to plant Catapala seed.—R. I., Fullerton.

Catalpa seed is not hard to start. We have grown it in flats, sown in good garden loam with the addition of some leaf-mold and sand. On top put some leaf-mould or chopped florists' moss for the soil on top of seeds must never dry out; therefore watch them carefully, and while not allowing them to dry out, do not drown out.

THE MANNA PLANT.

Editor Cultivator: I send you today under separate cover a branch of the blossoms of a shrub that I wish you would name for me through the columns of the Cultivator. I think it is a very handsome plant when in bloom, and am very anxious to know what it is.—G. A. S., Porterville.

Your branch is from Tamarix Gallica, the Tamarisk, or Manna Plant, native to the Mediterranean region. In its native country (and elsewhere) an insect stings through the bark. and from this puncture exudes the gum which was the "manna" which the Israelites gathered in the desert for food. It is a fine shrub for arid sections, yet thrives on saline soils right down to the edge of the salt water.

A "ROYAL" IMPORTATION.

We saw in the Los Angeles customs house last week a pair of the finest Buff Orpingtons ever imported addressed to "W. A. Stewart, Royal Poultry Yards, 202 Ave. 63, Los Angeles. Cal., U. S. A."

We were told by a customs house official that this is only one of several importations made by Mr. Stewart.

CODLING MOTH SPRAYING

The First Spraying.—Use three lbs. of arsenate of lead to 50 gallons of water. Apply when the majority of the blossoms have shed their petals.

* * *

The Second Spraying—Use one and one-half lbs. of arsenate of lead to 50 gallons of water. Apply between the 1st and 15 th of May.

* * *

Subsequent Sprayings—Use one to one and one-half lbs. of arsenate of lead to 50 gallons of water. Apply 20 to 30 days after the second spraying, and follow at intervals of one month until the latter part of August.

* * *

The Final Spraying.—Use 2 lbs. of arsenate of lead to 50 gallons of water. Apply by the 15th September.

* * *

The Application of the Spray.—All the sprayings should be applied very thoroughly. Use a power outfit where possible, and maintain a pressure of 140 pounds or more. The extension rods should be as long as the men can successfully handle, also they should be provided with a battery of two or three nozzles. The distance between the nozzles is a matter of considerable importance: if too close together the cones of spray will interfere, but if they are widely separated on the T the inconvenience of handling is greatly increased. If the nozzles are set so as to point away from each other at a slight angle the cones of spray will not come together nearly so quickly as when they are set parallel. This result is also obtained by using a nozzle which throws a narrow cone of spray, such as the long-distance Bean. When a hand pump is used it is not practicable to run so many nozzles or maintain such high pressures, but good spraying may be done with such an outfit if sufficient time is taken to insure a thorough wetting of the tree.

* * *

Spraying a Tree.—Do the inside spraying first, and then, beginning at the top, apply the overshot or outside spray. Do not finish the sides and bottom until the top is thoroughly sprayed. The men should walk completely around the tree, and spray directly at it from all points. Do not try to spray around a corner. Before leaving any part of a tree the man should stand well back and spray the tips of the most extending branches.

The orchardist should insist on the tops of the trees being sprayed first and thoroughly. If this upper work is done well the lower branches will receive almost enough spray from the drip, and they can be then finished quickly. thus avoiding the greater drip loss which comes about through beginning at the bottom. Do not waste spray on the trunk and large limbs which are bare of foliage.

* * *

The Material to Use.—Arsenate of lead is the arsenical which has been found sufficiently safe to use in the Pajaro valley. There are a number of commercial brands of this compound and probably several are of the right quality for use here. but from our experiments we can only recommend Swift's Arsenate of Lead and Disparene.

* * *

Spraying for Caterpillars.—The tent caterpillar is easily controlled with arsenate of lead used at the rate of 1 to 1½ pounds to 50 gallons of water. Spray as soon as the insects appear. Both this insect and the canker worm will be well controlled if the first spraying for the codling is applied. The tussock moth, or horned caterpillar, is a much more difficult problem, after this insect is a few days old it is very resistant to arsenical sprays. The very young caterpillars can be poisoned, however, and some experiments are in progress to determine, if possible, the practicability of very early spraying as a control measure. The thorough (complete) removal of the egg masses during the winter is the only treatment which is known to be successful.

* * *

The Apple Scab.—For the apple scab use the Bordeaux mixture. Apply with the first spraying for the codling moth or before. Use the 5-5-50 formula (5 pounds of bluestone, 5 pounds of lime, and 50 gallons of water) for the first spraying. This is prepared by dissolving 5 pounds of bluestone and 5 pounds of lime in separate vessels of water. Strain the milk lime to remove lumps, and then pour the two solutions together, agitating thoroughly. The best Bordeaux is prepared by diluting the solution with 25 gallons of water, and pouring them together, a pail full of each at a time. The result will be 50 gallons of Bordeaux. Hydrated lime will be found very convenient and satisfactory in preparing the Bordeaux mixture as it does not require shaking.

It may also be advisable to use Bordeaux with the second spraying for the codling moth. At this time use the 4-4-50 formula, i. e., 4 pounds of lime and 4 pounds of bluestone to 50 gallons of water, prepared in the same manner as the 5-5-50 formula. When arsenate of lead is used with the Bordeaux mixture it should be added when the Bordeaux has been prepared, and at the same rate as if the tank contained water only.—W. H. VOLCK.

A supply of the desert guide posts for which an appropriation was made by the last legislature, the purchase and distribution of which were placed under the management of the State Department of Highways. is now ready for distribution to the counties that have asked for them.

WHAT HAVE WE DONE TODAY

We shall do so much in the year to come,
But what have we done today?
We shall give our gold in a princely sum,
But what did we give today?
We shall lift the heart and dry the tear,
We shall plant a hope in the place of fear,
We shall speak the words of love and cheer,
But what did we speak today?

We shall be so kind in the after-a-while,
But what have we been today?
We shall bring to each lonely life a smile,
But what have we brought today?
We shall give to truth a grander birth,
And to steadfast faith a deeper worth,
We shall feed the hungry souls of earth,
But whom have we fed today?

We shall reap such joys in the by and by,
But what have we sown today?
We shall build us mansions in the sky,
But what have we built today?
'Tis sweet in the idle dreams to bask,
But here and now do we do our task?
Yes, this is the thing our soul must ask,
"What have we done today?"
—Woman's Life.

THE HUMOROUS SIDE OF A DOCTOR'S LIFE.

"Oh, yes," said one of the members of the medical staff of a city hospital, "doctors do have a good many amusing experiences over which they laugh a good deal among themselves, but of course it would be unprofessional to tell them with the names of patients and all that. But I don't mind telling you of some of my own experiences and of the experiences of some of my medical brethern. I shall leave you in ignorance of the times and places of these occurrences, and you may concern yourself with the stories alone."

"I remember that a man once came to complaining that he was all 'run down' and wanted me to try and 'figger out' what was the matter with him. I asked a few questions and at his urgent request made a careful examination of him. Then I told him that I found him to be perfectly sound.

"'Lungs and heart all right?' he asked.

"'Perfectly normal,' I replied.

"'What about the gizzard?' he asked in perfect seriousness.

"Mind you I don't vouch for it, but they are telling of a man who was to have an operation for appendicitis and he surprised his physician by declaring that he would not undergo the operation until his pastor could be present.

"'Why do you want your minister present?' asked the physician.

"'Because,' he said, 'I wish to be opened with prayer.'

"A cousin of mine who is a doctor in a country village told me that he had among his pitients a kindly, simple-minded old lady who was always surprising him with her childlike verdancy. One day she met him on the street and said:

"'Doctor, is it true that they take people's stomachs out nowadays and clean 'em and fix 'em when they ain't all right?'

"My cousin told her that the stomachs ot people had been removed by skilled surgeons under certain conditions, and she said:

"'Well, doctor, some time when you are passin' my house I wish you would stop an' get mine an' give it a real good washin' an' cleanin' an' fetch it back. Mebbe it would take the soreness out of it, an' I reckon I could get along without it for a day or two if I didn't eat anything.'

"My cousin said that he told her that he was not far enough up in his profession to engage in that kind of laundry work, and she said placidly:

"'Then I recon I'll have to put up with it as it is, but if it could be repaired some I'd like it.'

"This same cousin told me that he once had a big German farmer come to him with tears in his eyes. saying that he was afraid his wife would 'go dead.' After asking a number of questions my cousin cheered the worried husband by telling him that his wife could not be very seriously ill.

"'I will ride out and see her this afternoon, and I have no doubts that she will soon be quite well again.

"'I hope it may be so,' said the relieved Teuton. 'I haf lost me alretty this fall mine cow, mine best horse, mine dog und six sheeps, und now if mine vife goes dead I vill not haf an animal left on mine blace.'

"You may have read the story of the country doctor who had a man ring his doorbell at one o'clock in the morning, and when the doctor thrust his head out of an upper window to ask what was wanted the man said that his wife was very ill and he wanted the doctor to come at once. Inquiry revealed the fact that the man lived five miles from town. The night was dark and stormy, the roads were at their worst, and the doctor was utterly worn out from overwork. A few questions revealed the fact that the woman was not in a dangerous condition and the doctor said:

"'I can't go away out to your place tonight. I am more than sick myself. I'll tell you what you do, you go and get Doctor Blank to go and see your wife.'

"The man agreed to this, and the doctor returned to his snug bed only to be routed out by the same man half an hour later.

"'See here, my friend, didn't I tell you to go and get Doctor Blank?' asked the doctor sharply.

"'I did go to Doctor Blank and he stuck his head out of the window and told me to go to the devil, so I came right back here to you.'

"A woman once came to me complaining that she had 'population' of the heart and that her eyesight was so bad she feared the 'opular' nerves were affected, and she capped the climax by asking me if I thought 'this here appendysechus disease was contagious.' I once had proof that some of the strange and utterly absurd methods of curing the sick that obtained in our country a century or more ago still obtain in some localities. In the first years of my practice I lived in a little country town, and a woman came to me to ask me to go to her home to see her little girl who was very ill with the whooping cough. I asked her if she had used any remedies, and she said:

"'Yes, I've doped her with three or four different things and I've had her shuk in a blanket, but it ain't helped her none.'

"I asked her hat she meant by having had the child 'shuk in a blanket,' and she said:

"'Why, some o' my neighbors say they have known lots o' children to be cured o' the whooping cough by just putting it in a blanket and then having four strong persons take the four corners o' the blanket an jounced the sick person up an' down in the blanket, but it just made my little girl cough worse."

"An Irishman once came to me complaining of constant 'n'ises' in his head, and he said: 'The n'ises are so bad Oi can hear them fifty feet away.' He also complained of being very deaf in his 'off ear.' He was very garrulous, and before he left he had almost committed me to the holding of an 'awtopsy' over his body in case he 'wint off sudden.' When I asked him what reason he had for wanting an autopsy, he said: 'Bedad an' Oi've always said thot whin Oi died Oi wanted to know phwat Oi died ov, an' so thot is phwy Oi want an awtopsy hild on me.'

"A physician once told me that he had a patient so hopelessly ill that he felt it to be his duty to tell him that he could not live longer than a few weeks. Some days later, when the man was almost gone, he called at the house and was surprised to find the man's wife coming out of his bedroom arrayed in very elaborate and really becoming mourning with a thick crepe veil dangling to her heels from her fetching widow"s bonnet. When she saw the doctor she said:

"'Oh, good morning, doctor. I've just been in showing poor Jim how I look in my mourning that I've had made so as to have it on hand when it's needed. I thought it might be some satisfaction to Jim to see how I look in it. He always liked to see his wife rigged up nice. I suppose it's been a kind of sad pleasure to him—poor dear!'

"Doctors sometimes have abundant proof of the fact that the swathing of a woman in dismal black with

yards of depressing crape around her is often the outward symbol of grief that does not exist in reality. I know of a doctor who had a woman patient who was suing her wretchedly depraved husband for a divorce, and in the midst of the divorce proceedings he fell dead. The doctor met the fortunate widow on the street some days later. She was clad in the very extreme of mourning, and when she met the doctor she extended a black-gloved hand and said: 'Don't say a word, doctor. I feel like a fool in this stuff, but I thought there'd be more talk if I didn't wear it than if I did. So here it is. I guess I'm not the only woman in widow's weeds who feels cheap when she meets the family doctor."

IN THE HOUSE AND OUT.

A traveling correspondent of the Cultivator sends the following article, in part, from the Farmer's wife, which he says so aptly represents conditions in the average California home today, he thinks it ought to be republished in the interest of the farmers' wife who does her work in the home under such trying conditions and with so little mechanical assistance: "To one who has visited many farm homes in different parts of California it seems strange and unexplainable that so many labor saving inventions in field machinery are provided and so few that are needed in the house. The price of one of the larger farm machines would nearly if not quite cover all the cost that the farmer should place in the house for the use of his wife.

"The farmer may say that he cannot afford to buy more than he does, and that in order to raise the crops necessary to provide for his family he must have the help of machinery. But is his work of providing materials any more necessary than that of his wife's in preparing them for use? The food must be prepared for the table and clothing made and kept clean and whole. Besides the work, which keeps the farmer's wife employed more hours each day than he, she has the additional burden and strain upon her vital forces of child-bearing and care.

"It is not entirely from selfish or thoughtlessness that a farmer whose barn and machine shed contain every mechanical invention he needs on the farm, sees his wife performing the greater portion of the work in the house after his grandmother's methods Were the farmer obliged to carry on his farm work one season as did his grandfather, by hand labor entirely, he might see the need of modernizing the work in the house as well as in the fields.

"It is the practical machinery provided for the farmer of the present day which has enabled him to reduce his daily labor to the minimum and by which he is enabled to accomplish so much in a given time."

But we are constrained to say in this connection it is largely the fault of many women themselves that they still labor so hard. I have heard several declare they "would rather have a washboard than all the washing machines they ever saw," and many women, having begun housekeeping on small means by "getting along without things," that were really needed in the house, have continued to do the same in the later years of prosperity without suggesting the need of the many modern inventions the progressive farmer's wife finds so necessary to comfortable living. A sewing machine and a clothes wringer are all the mechanical helps to be found in the average farmhouse, though there are many washing machines in use. The farmer's wife should have, besides these, a patent ironing board that can be set up anywhere and folded and put away when not in use, a gasoline or oil stove for summer cooking, a carpet sweeper and a self wringing mop bucket, a kitchen cabinet, where all cooking materials and utensils are ready at her hand, and save her innumerable trips daily to the pantry, and a clothes-reel or a wire pulley line, that she may stand in one place, dry-shod, when hanging out the washing, instead of walking the length of a long clothesline in wet grass.

The farmer has a wind-wheel, or a gasoline engine, and tank, for pumping water for his stock, but how about the water supply for his family? An elevated tank should be put up and the water conducted into the house, a wet sink and waste pipe provided, and a bathtub and toilet convenience as soon as possible. This would save much hard labor, for only those who have been obliged to pump water for all household purposes for years or for a lifetime can know what a strain this one task is upon the housewife.

All the helps to comfortable housekeeping cannot perhaps be provided at once, but may be planned for and purchased one at a time. The farmer's wife needs and should have every mechanical assistance possible in her work, as the farmer has in his.

RULES OF CLEANLINESS.

Without cleanliness and punctuality, good cooking is impossible.

Leave nothing dirty. Clean and clear as you go.

Haste, without hurry, saves worry, fuss and flurry.

Stew boiled is stew spoiled.

Strong fire for roasting, clear fire for boiling.

Wash vegetables in three waters.

Boil fish quickly; boil meat slowly.

A good cook wastes nothing.

Cookery Recipes

BAKED APPLE AND NUTS.

Remove cores and stuff the apples with chopped walnuts or pecans. Cover them with sugar, add a little water and bake in the usual way.

POTATO PUDDING.

Press mashed potatoes through a coarse sieve; to one quart of potatoes add one-half cupful of cream and the yoke of one egg beaten together, salt to taste and also a tablespoonful of chopped parsley; lastly fold in the stiffly beaten white of one egg and put the mixture in a pudding dish; drop small pieces of butter on the top and put in a quick oven over ten minutes to brown.

A RICE PUDDING.

Wash one-third cup of rice and put into a buttered pudding dish with four cups of milk, one-half teaspoonful of salt, one-third cup of sugar, and the grated rind of one lemon. Bake three hours in a very slow oven, stirring three times during the first hour of baking to prevent rice from settling. serve hot.

A MODERN FAMILY.

Grace is in her study,
  Modeling in clay,
  Maude is getting ready
  For the matinee.
Jane is writing verses,
  In the lower hall,
Where Genevieve rehearses,
  Plays at basket ball.
O'er a love tale sighing,
  Edith hides her face,
While Antoinette is trying,
  To decorate a vase.
Brother's at the casement,
  Bawling for his lunch,
And ma is in the basement
  Cooking for the bunch.

Climate and Crops

General Summary.—The week was unusually stormy throughout California. The rainfall was phenomenally heavy in most places, and comparatively high temperatures in the afternoons caused a rapid melting of the snow in places. Fortunately the week closed with clearing cold weather. For the reason mentioned above nearly all of the rivers rose rapidiy, and in many places reached stages above the danger line.

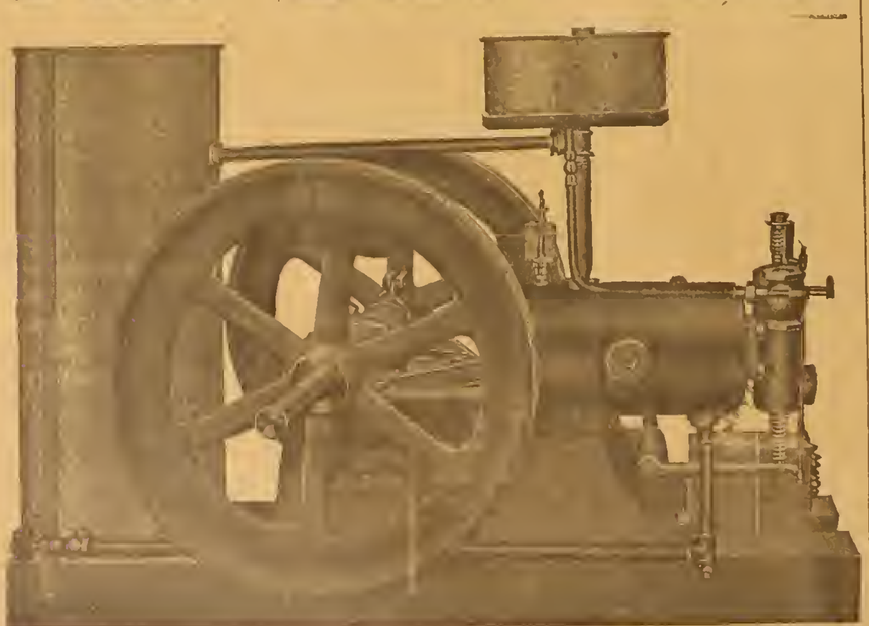
Coast and Bay Sections.—Numerous rain squalls occurred during the week, with very heavy rains at the beginning of the week and also on Friday and Saturday. Amounts ranging from one inch to nearly two inches were recorded in 24 hours, ending Saturday morning. The wind attained velocities ranging from 36 to 72 miles per hour from the north west along the coast north of San Francisco. A small amount of snow fell on Mt. Tamalpais at the close of the week. On Thursday afternoon temperatures reached 74 degrees. Notwithstanding the high wind light frost occurred Monday morning.

San Joaquin Valley.—Cloudy, stormy weather prevailed throughout the week, with rain on four days. The rain was not as heavy in this section as elsewhere in the State, and fair weather on Tuesday and Wednesday allowed the high waters in the rivers to gradually lower. Afternoon temperatures reached as high as 74 degrees. Heavy frost occurred on Monday morning. Much snow is reported in the mountains. Thunderstorms were reported in the vicinity of Lodi.

Southern California.—The week began with heavy rain and brisk southwest wind throughout the entire country south of the Tehachapi. In the 48 hours ending Tuesday morning the rainfall in the vicinity of Point Conception amounted to nearly two inches. At Los Angeles more than an inch and a half fell. All of the reservoirs are filled and there is every prospect of an abundant supply of water for the coming season.

During the month of March more than seven inches of rain fell at Los Angeles and nearly five inches at San Diego.

The Sure-Go



For all the purposes and uses to which Gasoline Engines may be applied our Sure Go Special will be found better than the rest.

It is built on true scientific principles and is acme of mechanical simplicity.

It has no intricate parts, is compactly built, with proper adjustments to take up, wear and maintain perfect alignments.

A glance at the illustration will prove the correctness of the design for strength and even balance.

Our price is the lowest and our engine is the very best.

CITRUS MARKETS

During the past week the eastern orange market has undergone most unusual fluctuations, the range in price, in some instances, being fifty cents per box. This uneasy condition was caused by cold snaps, but at present the prices are steady at the same satisfactory scale as for some time past. All interested are agreed that the entire season is one that will prove highly satisfactory to the California grower.

NEW YORK, April 3.—Twenty-nine cars were sold at auction today. The weather is favorable.

CATCHING PICKPOCKETS.

The Sharples Separator Co., of West Chester, Pa., have a man in almost every town who makes it his business to catch pickpockets. Strangely enough, these pickpockets are always caught robbing themselves—and are always farmers or dairymen. The Sharples Separator Company's men do not send these convicted self pickpockets to jail, but show them how to make **more** money. They prove to them that, if they have not a famous Sharples Tubular Cream Separator, they are picking out of their own pocket one-third to one-half the profits they should make from their milk—that they are, in fact, losing one-third to one-half of their cream. These men can convict **you** of robbing **yourself.** They will do it, either by lending you a Tubular for a free trial, or by skimming for you, free, a batch of milk you have already skimmed with pans or cans, and taking out of that milk, which you think is skimmed clean, the cream you have left in it. This proof won't cost you one cent, but will help you increase your butter money from one and one-third to double what you now make. All you need to do, to find out how much cream your pans or cans lose, is to borrow a Tubular from the agent for a free trial, or take a batch of skimmed milk to the nearest Tubular agent. The result will surprise you, cost you nothing, and put money in your pocket. We suggest that you write The Sharples Separator Co., of West Chester, Pa., about this, at the same time asking them for catalog No. N260.

AN ARTISTIC CATALOGUE.

Howard & Smith, of Los Angeles, are sending out the most ornate, original and altogether the finest catalogue of ornamentals ever issued by a nursery firm on the Pacific Coast. It is, in every sense, a work of art.

A Better Way
To Go East

Than is offered by the Salt Lake Route may be available some day but not at present. Let us suggest some reasons why you should go that way on your next trip.

Because, if you came west via the Salt Lake Route you must have been so well satisfied with the service and comfort enjoyed that you want to return the same way.

Because, if you came west some other way you surely should return via the Salt Lake Route to see a different part of the country.

Because, it traverses a country full of interest, pictiresque and unique in many ways.

Because, it is the short line via Salt Lake City, where you may stop and see the sights of that Mormon city without extra expense.

Because, it runs the famous "Los Angeles Limited," one of the finest and fastest trains in the west, carrying both standard and tourist sleepers through from Los Angeles to Chicago via Salt Lake City, Ogden and Omaha. Therefore, if you prefer to travel in a tourist sleeper you may go just as fast as the passengers in the standard cars, and considerably cheaper.

Because, on the "Overland" are standard sleepers through from Los Angeles to Ogden and Denver and tourist sleepers through to Denver, Omaha, Kansas City, St. Louis and Chicago, over the various lines east of Salt Lake City, enabling you without change of cars to see Rocky Mountain scenery to your heart's content.

Because in both trains are run Dining cars in which are served excellent a la carte meals, whitch may be enjoyed at your leisure; no short stops at stations for quick lunch.

Because, well there are other reasons which any Salt Lake Route Agent will be glad to explain to you. Just call on the nearest one for more particulars, literature, etc., or write

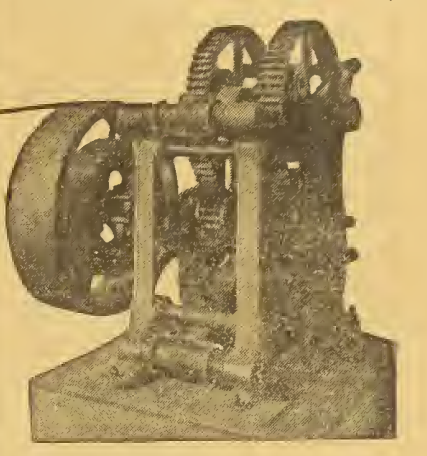
The Pomona Pump



The New Pomona Pump is now being manufactured with machine cut gears and machine cut steel or bronze pinions. The pump fitted with this kind of gearing runs as smooth as a clock and there is absolutely no noise or vibration. The company have recently taken contracts for installing their largest sized pump with this class of gearing for the Artesian Belt Water Company of San Dimas, Western Water & Power Company of Glendora and other large irrigation companies. They are required to furnish these pumps with cylinders up to 12 inches in diameter and 72 stroke which has capacity of over 60 Miner's inches of water. The valves are made entirely of phosphor bronze with ground metal taper seats so there is very little obstructiin to the water in passing through them and it is impossible to clog them with sand. These, in connection with machine cut gears, in the pump head, make a strictly high grade pumping outfit and the best by along ways of anything on the market today

This head and valves are both protected by United States patent. Beware of infringing as both manfacturer and user are liable

The company has recently installed one of their latest Improved heads for the Santa Anita Land Company, a subdivision of the Baldwin Ranch Below is what the owners have to say about it:

"The new 38 pump you installed for us on our tract on the E. J. (Lucky) Baldwin Ranch is giving us satisfaction in every way. We think we have the very best that money will buy. Both as regards to pump, material used and installation. We made an excellent change when we removed the pump we had been using and installed your make."

We have pleased these people and there is no reason why we cannot please you.

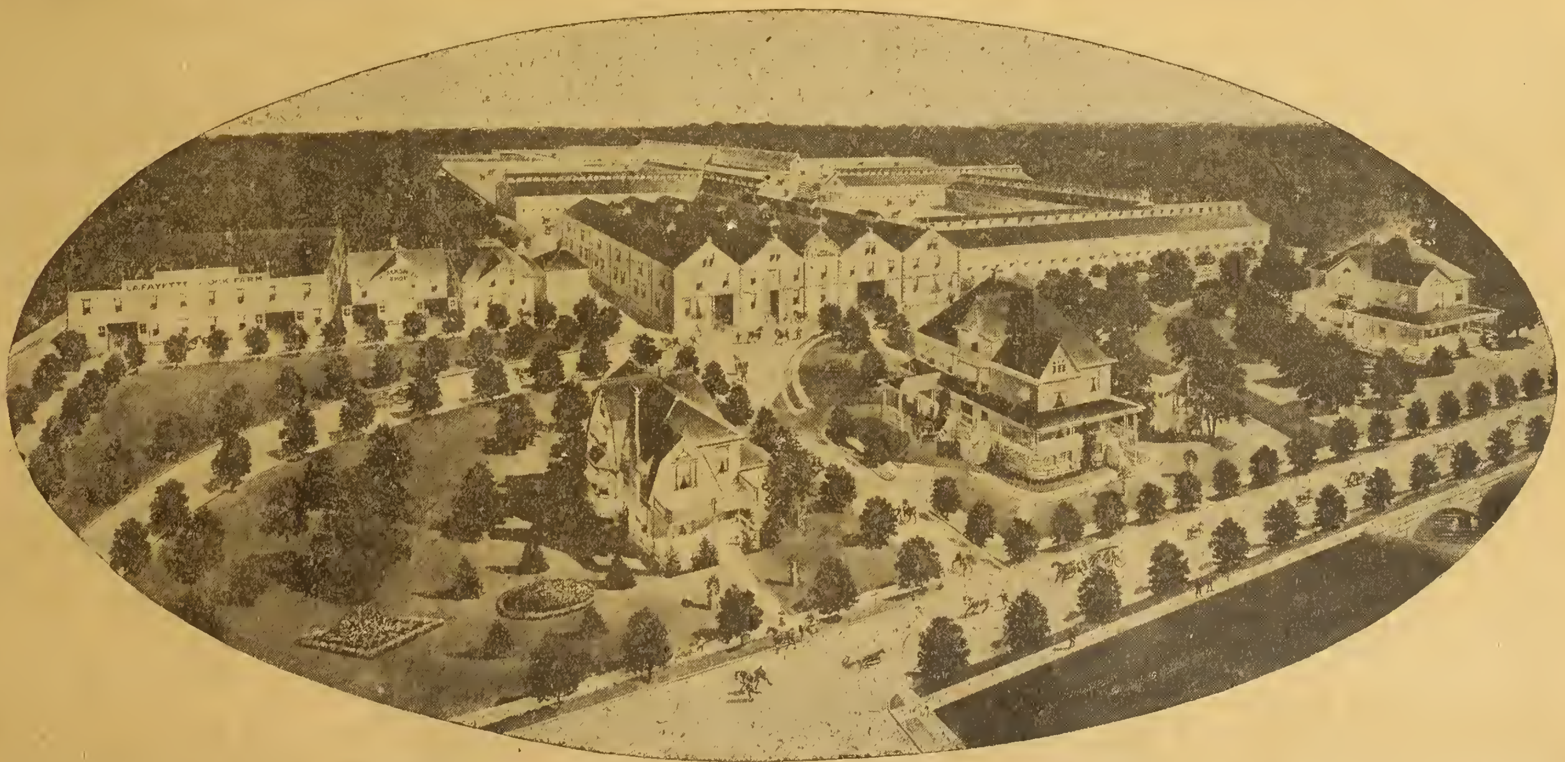
CALIFORNIA CULTIVATOR

DEVOTED TO AGRICULTURE IN ALL ITS BRANCHES

LOS ANGELES APRIL 13, 1906 SAN FRANCISCO



Bird's-eye View of the Lafayette Stock Farm, Lafayette, Ind.—J. Crouch & Son, Prop's. Largest importers in the world of Oldenburg German Coach, Percheron and Belgian Stallions.

Horse breeding is one of the most important industries in the United States The reports in the Year Book of the Department of Agriculture show large increase in the prices of the best grades from $10. to $35. during 1904, 1905 inclusive. Draft horses show the greatest increase for that period occasioned by the scarcity. January 1, 1905, there were 363,339 horses in California valued at $24,518,741. The increase in draft horses for breeding purposes, of the character of the Perchon, Clydesdale and other strains, is adding many thousands of dollars to California's Animal assets annually.

Mrs. C. A. McDonald is advertising White Wyandotte and Indian Runner Duck Eggs in the Cultivator.

Some thoroughbred Holstein bull calves are being advertised by Mr. J. M. Spencer of Compton, Cal., in this week's issue of the Cultivator.

The Santa Anna Chamber of Commerce has adopted a resolution in favor of suporting a local ice plant as against outside competition.

H. H. Holland advertises setting eggs for sale of the different breeds at very moderate prices. The El Oro Poultry Farm has an established reputation all over California.

Kellogg's Ant Paste, advertised in this issue, seems to have been giving very good satisfaction. The manufactory is at 1010 East Ninth street, Los Angeles, and their paste is sent by express. Local dealers wanted to handle their goods.

Fifteen thousand pounds of butter, the product of two creameries, was awaiting shipment at Tulare Saturday. The butter was sold to Los Angeles parties.

The Pacific Coast Borax Company, of San Francisco, offers free samples of their Twenty-Mule Team Borax, for cleansing anything in the way of milk cans and dairy utensils, as well as anything in the kitchen or laundry. Their products are sold by all dealers, in packages.

The old established G. W. Price Pump Company of San Francisco, are advertising Calahan Distillate Engines in this issue. It is a first-class engine at a very moderate price, and like all the rest of the goods sold by this firm, are guaranteed and satisfaction insured to the purchaser.

The Stearns Gas Engine works of Los Angeles, report a good season in the sale of gas engines, notwithstanding the heavy rains which have discouraged some in making investments in water lifting machinery this year. The Stearns people are putting up a good and economic engine and its merits are appreciated by many of the farmers who find it most satisfactory as a water lifting power.

For the first time in eleven years water is flowing over the top of the Sweetwater reservoir, and now every effort is being made to let out some of the water and prevent such a large amount going to waste.

M. E. Dillingham, the popular superintendent of the Southern California Poultry Show, and Wyandotte breeder of San Gabriel, has just imported one of the whitest of prize winning Wyandottes to his yards. We have seen the bird and it is a beauty in form and feather, and gives added value to Mr. Dillingham's fine strain of White Wyandottes.

REDOUBLED THE SIZE.

The dairy and creamery supply house of the O. J. Weber Co., has met with such success that it has already been compelled to occupy twice the space formerly used and has taken the room adjoining its former location, through the wall of which a large archway has been cut, making the two large rooms into one. Mr. Weber now claims the largest stock and store in Southern California. The present location is 555-557 South Los Angeles street.

SOAP AND RAZOR

Pay as much attention to the soap you shave with as to the razor. The razor may pull a little, but that's soon over. Poor soap will make the face sore, and that lasts. For your face's sake get out of the habit of using the soaps you wash with. If you don't know what else to use, send off to the J. B. Williams Co., Glastonbury, Conn. They will send you a sample of Williams' Shaving Soap free. If you don't like it, you had better let your beard grow than go on using laundry soap. If you do like it, and we guess you will, you can buy it at any drug store. The little it costs for your month's shaving will cut no figure when you know the soap.

What We Poultrymen Need

What we poultrymen want is to get a first-class feed that we can depend upon to raise our chicks and raise them without a loss.

We want a feed that will raise the LARGEST PERCENTAGE of chicks—a feed that will put LIFE INTO THEM and make them VIGOROUS, STRONG and HEALTHY.

And we also want a feed that will feed the chicks the first six or eight weeks at the smallest cost, or least expense, considering the amount of chicks raised—so that we can raise chicks until two months old at a cost of about 7 cents per chick for the feed—so that we can make some profit, as we need to make the money—it comes handy to us at all times.

We want a feed that will make the chicks thrive, and keep them free from bowel trouble, and also keep them from pecking each other—a feed that will make the chicks grow so fast that they can separate the roosters from the pullets at the age of five weeks, and at the age of two months send the roosters to market and get from $4.00 to $6.00 per dozen for them.

Above all, we want the feed that will raise the LARGEST PERCENTAGE of BIG, HEALTHY CHICKS.

Feed For Little Chicks

Raise chicks—raise lots of them, so that you will have a big flock next year. To raise them successfully you must have the proper feed that will fully nourish them so that their growth will be continuous and they will become big strong, healthy fowls. It dosen't pay to be stingy with the chicks—give them the best food you can get—it means so much to them later on. For the first four weeks feed the chicks COULSON'S SPECIAL DRY CHICK FOOD, which is composed of small pieces of cracked grains, also a variety of seeds and small pieces of charcoal, meat and bone. It therefore contains a variety of the best and most wholesome ingredients in the right proportions to promote the growth of the chicks and turkeys, and fully nourish them so they will reach the average weight of **three pounds each,** from four to six weeks sooner than when fed on common food. 100 lbs. of this **Special Chick Food** will feed 400 chicks the first three weeks.

There may be many other kinds of Chick Feeds which your dealer may tell you is just as good as Coulson's. But don't be deceived; insist upon having COULSON'S SPECIAL. Your success may depend upon it. If your dealer can't supply you, send direct to factory at Petaluma.

COULSON'S SPECIAL DRY CHICK FEED
THE BEST FEED FOR LITTLE CHICKS AND TURKEYS
COULSONS SPECIAL DRY CHICK FEED
100 LBS.
COULSON'S SPECIAL DRY CHICKFEED
MANUFACTURED BY A.R.COULSON & CO. INC. PETALUMA CAL.

A. R. COULSON, the Chicken Doctor, feeding a flock of young chickens with **Coulson's Special Chick Feed.**

This lot of 800 chicks were fed entirely on **Coulson's Special Chick Feed** up to seven weeks, at a cost of 2½ cents per chick. The first 25 days, each chick consumed an averaage of 1 cent's worth, and up to five weeks, 800 chicks were fed 400 pounds of **Coulson's Special Feed,** nothing else.

Figuring the Chick Feed at $3.50 per hundred, 4 sacks would be worth $14.00; or 1¾ cents worth to feed a chick up to 5 weeks of age, and it makes such **strong, healthy,** robust chicks, that are a pleasure to look at.

Chicks beginning life on Coulson's Chick Food—raised on **Coulson's Special Dry Chick Feed.**

Broilers sold when two months old for $5.00 per dozen.

Pullets began laying whe nfour months old. Hens that are champion layers—200 eggs per year hens, because they had the right start.

$1.00 a Dozen More

By feeding your Chicks on **Coulson's Special Dry Chick Food** they will be so large and plump that besides sending them to market sooner, you will get from 50c to 75c and possibly $1.00 a dozen more for the broilers or fryers than your neighbor who has chicks of the same age and who feeds some other kind of feed.

Try It This Year

Ask your dealer for COULSON'S SPECIAL CHICK FEED. Tell him no other kind is good enough for you. You want the best, and that's **Coulson's Special.**

FREE A nice Book **"Raising Chickens"** 104 large pages, 200 pictures. Interesting. Send 10c postage. Address Publishing Department

Vol. XXVI—No. 15 LOS ANGELES, CAL., FRIDAY, APRIL 13, 1906 Subscription $1 a Year

Proper Care of the High Bred Horse

H. C. Beville, of Hollywood, has very recently come into possession of a very beautiful and valuable foal, through his well known mare, Pauline, known among horsemen in Southern California, as one of the finest and best bred animals in this part of the State. The cut of this mare and colt, which accompanies this article, does not do full justice to the pair. They should be seen in their natural position in the field to be fully appreciated.

The rearing and care of a thoroughbred colt, as well as the care of the mare is a subject of interest to all lovers of well bred stock, whether horses, cows, swine or pets, and the proper care of the mare and colt is a study which the owner must make to get the best results from both. A thoroughly informed horseman, A. Stenson, of Wisconsin, in the Farm, Stock and Home, gives his experience along this line in the following interesting paper which is printed herewith. The suggestions he makes in reference to the horse are practical, for we have proven them, in ownership and care of a thoroughbred horse in Iowa.

Mare and Foal.—The mare and little foal should be kept in a roomy box stall for three or four days; then they may be put out in a paddock, or small pasture, during the day, but taken in at night, for two weeks, at least. After that, they may be left out, unless the weather is bad. When the colt is about a week old, a light leather halter, with a short piece of strap attached, should be carefully fitted to the head. Every day pet and handle the colt a little. In a very short time he will learn to lead, with no pulling or straining of the soft, young joints. Teach the colt to eat grain with the dam as early as possible, then put in a small feed box, and give him his regular feed when feeding the dam. The horse's stomach is small, and from seven in the morning until three in the afternoon is too long a time to go without being fed. The noon meal should be simply oats. Give the heaviest feeding at night, when the horse can rest and have time to digest it properly. Unless a stable is kept clean and free from bad odors it cannot be healthful. The ventilation should be good, but there should be no drafts. To put a warm or heated horse in a draft is certain ruin. If a horse has become heated from a drive, or work, he should be thoroughly rubbed and walked in the open air until partially cooled, at least; then cover him with a woolen blanket. Never allow a sudden chilling of the surface. For at least an hour, only a few swallows of water should be given. People who disregard these common sense rules invariably have unsound and ailing horses.

Points on Grooming.—The process of grooming requires great practice and experience in order to remove all the deep-seated dirt and loose scales. Cleaning the legs is also an important point in grooming. In dry weather simple brushing out is sufficient followed by hand rubbing. In wet or windy weather, when there is mud, washing of the legs is generally resorted to. This practice, as it is commonly performed, should be condemned. It is not so much the actual washing that should be objected to as the fact that the legs are almost invariably left damp. This is a prolific source of inflammation sometimes running on to destruction of a portion of the skin, as in cutaneous quittor, erythema, etc. The mud commonly gets the blame, but experience shows it is not the mud, but the washing aggravated by bad weather, which produces these evils. If the legs must be washed, they should be rubbed until they are not only thoroughly dry, but warm. After this they should be bandaged.

Thousand Dollar Foal of H. C. Beville.
Rex Montgomery, sired by Rex Montgomery No. 2011. Dam Pauline, whose sire was Ike No. 728, the famous Kentucky saddle and driving stallion.

* * *

Pasture Mare and Foal.—The proper place for a foal is with its mother in pasture field, where there is abundance of water, grass and shade. But when this is impossible the mare should be worked as lightly as possible and fed liberally on milk-producing food. The production of milk in all mammals is facilitated by food of the same inherent qualities. Oats, corn, and bran are standard foods for this purpose for all farm animals; and if moistened the effect is still better. Grass should be supplied, and as far as possible take the place of hay.

Encourage the foal at an early age to feed by itself, and provide a trough to which it may have ready access. Oats more than any of the grains contain bony structure of young animals, and may be fed liberally without danger of overfeeding. A foal should be steadily developed from birth. No backset should be allowed. Give up the notion that the foal is just so much more profit derived from the mare—unless willing to put up with an ill-shaped and ill-conditioned foal, which will develop into a low priced horse, no matter how finely bred.

* * *

Stabling the Horse.—Some of the highest veterinary authorities contend that glanders is not contracted by contagion alone, but may be caused spontaneously through unsanitary surroundings. Strangles and influenza, also other serious diseases, are very often caused through the housing of horses in badly ventilated stables, and the constant breathing of vitiated air. In the general management of the horse the conditions under which he is stabled are therefore of the utmost importance. Though deprived of food and water, animal life can exist for a short period without much inconvenience, but continuous breathing of air is absolutely necessary to life. Hence air is the chief requisite of life; this being so, how absolutely necessary it is that the atmosphere surrounding the horse in his stable should be pure if the animal is to be kept in good condition and all diseases avoided. Unfortunately, too little attention is given to ventilation in most farm stables, more care being usually bestowed in making the stable warm than in admitting light and air. If we observe the natural habits of the horse we will learn the value of pure air for him. Where a shelter is provided for horses at pasture they will seldom seek its protection, even in the coldest weather, preferring above all things an abundance of fresh air. In different parts of England, where in the summer season horses used for pleasure coaches are turned into a pasture at night, they are found to do their work better and last longer than those confined in close stables. The nature of the work performed by the horse renders him especially liable to injury from breathing bad air; during hours of work in the open air the horse's lungs are extended to the fullest capacity in supplying the oxygen used up by his system under the strain of muscular exertion—take him then suddenly out of the fresh air into warm, moist air possibly poisoned with the effluvia of a carelessly cleaned stable, and the result cannot be other than very injurious. The muscles are relaxed, the deep, breathing lungs filled with vitiated air and the whole system weakened. In building a stable it should be so placed as to admit plenty of sunlight and air. Observe how a horse stabled in a box with open windows invariably seeks the morning sun; the sun-light is a pleasure to him as well as to man. Nothing can be more depressing than a dark, close stable. Windows should be placed above the horse and made to open on a swivel, thus giving perfect ventilation while guarding against drafts. The divisions between the horses should be low; though to at the head, which will not in any prevent biting at each other a few bars may be placed half-way down way prevent the free circulation of air. All drainage should be by means of an open drain behind the horses in the stable, discharging, if desired, into a covered drain outside so as to admit of thorough cleaning and flushing inside the stable—the outside drain being properly trapped so as to prevent any foul air passing back. In very cold weather warmth is better obtained by extra blanketing than through warmed air. With a fairly warm blanket the horse will suffer no discomfort in a cold stable, but will be all the healthier and stronger the greater the supply of pure, cool air.

Horse breeding is profitable or unprofitable according to the kind of horses you raise. If you breed to suit the markets—the big draft and the handsome carriage horses—you will have the horse-buyers after you and get big prices.

MODERN DAIRY BARN.

The Dairy Division of the Bureau of Animal Industry, Department of Agriculture at Washington, has just issued a small circular entitled "Suggestions for Construction of a Modern Dairy Barn." The plan of the barn shows that the structure embodies the best ideas in scientific and sanitary construction that are consistent with practicability and cheapness. We advise all interested in such a publication to send to the Secretary of Agriculture at Washington for a copy of it.

Deciduous Fruit Culture

BY J. W. MILLS, POMONA, CAL.

PRUNE TREES ON PEACH STOCK.

A grower asked us the other day if it were advisable to graft peach trees over to French prunes. We would not graft anything to French prunes in Southern California.

Peach is a good stock for prunes on good, well drained soil. On soil that is inclined to be wet, Myrobalan is better. We would not graft peach trees over to prunes at any rate. If the variety is of little value, graft them over to so emgood variety of peach. Unless the trees are on very rich land and are of exceptional vigor it will not pay to work the mover after they are over 10 years old. In Southern Californio we would work into Salwav, Henrietta or Lovell. For the northern deciduous districts the variety will depend on the purpose for which it is intended. Nearly al peaches do well in the central valleys of the State.

BORERS.

Borers are the bane of apple and pear growers but with a little precaution this need not be so. Apply a thick coating of whitewash to the entire trunk and large branches, from the leaves clear to to the ground. If the trees are small it may be quickly done with a brush. Make the wash a little thinner than cream and add a handful of sulphur to a bucketful of wash, and half that amount of salt. The sulphur will send off fumes that are distasteful to all kinds of animal life. The salt makes the wash stick to the trees. The object of the whitewash is to prevent the bark from becoming sunburnt, or are not slightly injured by the sun. If borers have already entered the tree, there is no way of getting rid of them except to dig them out. If the worms have just hatched and have not entered beneath the bark, painting with soft soap and wrapping with any kind of paper (except black paper) will kill them. This is not theory, but facts, we having successfully treated ten acres of Bartlett pears after they had become infested with the minute worms which could be seen just beneath the thin transparent bark. The young borer seems to need a little dried bark and plenty of hot sun to start him on his work of destruction. These suggestions will apply to any trees subject to the attacks of borers.

PRUNING YOUNG APPLE TREES

The treatment of young apple trees should be quite different from that of most other deciduous trees when it comes to the shaping of them.

We at one time pruned some apple trees when they were in their second year, just as we would have done had they been peach trees. Two years later we saw our mistake. We had to cut out a good many branches that started from the pruning they received when they were two years old. Our experience with apple trees of all ages up to fourteen years, convinces us that an apple tree should not have more than three main branches, and these should be distributed so that they do not come out near to one another or opposite. These should not have permanent branches closer than two feet from the bases. It is well to allow small brush to grow over the bases of the main branches for shade.

Where limbs fail to branch out and fill out the tops or vacant places, they should be cut off at the point where the branching is desired. When the branches run up too highh, they should be cut back and always to a lateral which is growing in, if on a tree that is inclined to spread, and to one which goes outward in a compact tree. Open spaces may be filled in this way. If these methods are followed, the trees will become shapely and will not require much pruning at any time. Some apple growers do not recommend pruning at all on young apple trees, but we think some is better. If the pruning is severe, the trees will only make a more vigorous growth and will have to be cut back again. Fast growing and rank trees should be pruned less severely than feeble ones. The Winter Nelis pear is a striking example of the first. It is useless to try to shape a young tree of this pear unless the branches are tied in place. If it is left to itself, it will soon finish its rampant growth when it may be shaped.

CLIFORNIA NEWTOWN PIPPINS.

There appear to be various indications that Californian Newtowns are becoming year by year more dangerous to handle. Last season you had a serious blight which we presume might very easily recur, and which moreover might not develop early enough to place you on your guard against handling them. This year the apples appear not to be keeping so well as heretofore, although there are no noticeable features which bring about this result. In previous seasons we have experienced unhealthy cores, but that we presume was an exceptional characteristic.

So far as we can judge these various increasing dangers probably arise from continuous cropping without proper fertilization, and unless steps are taken by orchardists to replace the consequent exhaustion of the soil our view is that it is only a question of time—and probably only of a very short time with respect to old orchards—before the quality of California Newtowns will be so much impaired as to seriously prejudice their value in this market, and to correspondingly jeopardize the business of handling them. Our view is that the trees are being called upon to a greater extent than they are competent to perform, and that nature will fail to respond to these continuous and exhausting demands.

We shall be glad if you will take both scientific and practical advice — science and experience should go hand in hand in these matters—with the view of determining what if any foundation there may be for our apprehensions. Incidentally, of course, you will doubtless advise orchardists to fertilize their orchards in any event, and we feel sure that the expense of so doing will be fully compensated for even if such fertilization may not be absolutely necessary from the point of view to which we have referred.

We, of course, do not profess to have any knowledge on such matters, and merely draw your attention to the matter because it seems to us a most reasonable thing that continuous cropping must either exhaust the soil or the trees, or both, unless something is done to restore the wastage of fertility and strength. The rule that prevention is better than cure particularly applies in this case, and fertilization should be provided well in anticipation of exhaustion, the reinstatement of fertility being a much more difficult matter than the maintenance of it. On this point we do not doubt that you will fully agree with us if in point of fact, as we suppose, there is some cause for apprehension.

Our expectation is that the expense of fertilization would be compensated for by the better keeping qualities of the fruit, even if large supplies in the early Winter months should as heretofore depress prices during that period.—From European agent of Balfour, Guthrie & Co.

* * *

So far as we know, the trouble is a new one, and its causes are not understood. I cannot, therefore, indicate to you any definite line of experiment with respect to remedy for the trouble. Its nature is such that on the whole it seems idle to attempt to remedy it by any nitrogenous fertilizer. Such difficulties are more generally present in fruits grown in soils with an excess of organic matter. I would, therefore, suggest that mineral fertilizers be used in the form of Thomas Phosphate, and of potash sulphate in kaenit, which would add chlorin to the soil.

The antidote to such diseases of fruits is usually lime and phosphoric acid, especially the former. Inasmuch as the Thomas Phosphate carries both, I think it most likely to produce the best results. To make the first year's experiment of value, however, a rather large dose should be used, and plowed in deeply, so as to come in contact with the feeding roots. To put it on the surface, or harrow it in, would be entirely inconclusive, as then it might not reach the feeding roots at all this season. I should advise 500 pounds per acre to make the experiment cogent, and of potash sulphate not less than 150 pounds—the latter need, of course, not be put in so deep as in the present condition of our soils and weather it would work itself in fast enough.

Regretting that I cannot give you more definite information of the nature of the disease, I make these suggestions as the best available.—Extract from letter of 26th March, 1906, from Prof. E. W. Hilgard, University of California, Berkeley, to Balfour, Guthrie & Co., San Francisco.

Government engineers are at Woodland for the purpose of making extensive investigations as to the modes of irrigation, under the joint appropriation of $150,000 by the State and Federal governments. They are inclined to believe that the water here is used extravagantly and will make a test to ascertain the percentage of waste in ditches. They will also make experiments on grain and corn lands, with a view of determining the practicability of irrigating those lands and if water replenishes the fertility of the soil.

District Attorney Evans of Riverside County has rendered an opinion that travelers, tourists and visitors temporarily in California should not be taxed for personal property which they have brought with them for their comfort or pleasure.

Reports indicates that the fishing season, which opens on the 1st of April, will be late on account of the heavy storms hich have swelled the mountain streams to twice their size, thus giving the fish plenty of feed for a month or two.

The trustees of Compton High School will beautify the grounds by planting about 100 ornamental trees consisting of sterculias, acacias, crepe, myrtle, genista, spirea and Montmyrtle pine. Let their example be followed by others.

Hens should receive plenty of exercise when laying the eggs you intend to set.

SPRING MANAGEMENT.

Some Valuable Hints Concerning Stimulation to Induce Eearly Breeding.

This is the most important season of the year for the bee man; he should now examine each colony for the purpose of ascertaining whether or not the honey stores have been exhausted, also how brood rearing is progressing. The Apiarist should bear this in mind the colonies that give the largest surplus in the honey season are generally very strong in the spring There is no better way to get colonies strong early in the spring than stimulated feeding, combs of honey do not in any way give the stimulus that thin syrup made of eaqul parts sugar and water or better honey and water if honey is very thick dilute one part honey to five parts water. Out door feeding is the best for all purposes, however, if one is located where there are numberless bee trees, it would be impossible to do so, or if located where there are two or more bee men however, one can generally make satisfactory arrangements, either feeding together, or by paying the party feeding a small sum for sugar and honey. A good out door feeder can be made very cheaply. For one hundred stands make two small V shaped troughs from fourteen to eighteen feet long. Place in these throughs shavings or excelsior; this will keep bees from drowning in struggling against each other. Where it is impossible to feed in open air you will have to feed in the hives. You can do this by pouring the feed on combs or better, put feed in a Doolittle division board feeder. You can get them from any supply house or you can make them yourself. Take an ordinary hive frame; on the sides of frames tack or nail these boards; then take melted wax and pour in the feeders to seal the cracks and stop leaks. It is to be used inside combs. If brood rearing is increasing nicely, a very good pian is to spread broad. Take one or two combs of cappep brood from center of hive placing them inside of brood nests putting worker comb in their place. Now is the best time of the year to cut drone comb, replacing with sheets of foundations.—M. D. Whitcher.

ITALIAN, BLACK AND HYBRID BEES.

The black or German bees were imported into this country some time in the seventeenth century, and they are now widely distributed from the Atlantic to the Pacific. They were the only race of honey bees in this country up to 1859. Through the agency of the Department of Agriculture, the Italians were imported direct from Italy in 1860. There had previously been repeated individual effort to procure Italians bred in Germany, where the race had been introduced some years earlier, and a small number of queens had been landed here alive in the Autumn of 1859, but most of these died the following Winter, and the few remaining alive seem not to have multiplied as rapidly as those obtained in Italy, by a purchasing agent of the Department of Agriculture, and landed here early in 1860. Their good qualities were soon appreciated, and they rapidly became universally distributed.

A few years after the Italians were introduced, races of Cyprians, Carniolans, Palestines, Egyptians, Syrians and Tunisians were imported to this country, but none of them had the qualities that Italians possess, and today the latter are by far the most popular bee in the United States. The Italians can readily be distinguished from other races; they show across the abdomen when the latter is distended with honey not less than three yellow bands. They are much easier handled than blacks or hybrids, are better honey gatherers, and more prolific. Blacks and hybrids can in no way be compared with Italians. Hybrids are mongrels produced by blacks and Italians crossing. They are generally so variable in temper, honey gathering and prolificness that nothing can be said in their favor. Occasionally we will find a colony of hybrids that come up to the Italians, but one can never get good results from them when used as breeders. For instance, say we have a dozen daughters of a hybrid queen, and introduce them in as many colonies; we will soon find that among the dozen there are no two colonies alike. Some will be very cross, making it very disagreeable work when handling them and from others we will get very little surplus, and generally we will find three or four that never had more than three to four frames of brood at a time. And here is a fact it is well to remember: a queen that cannot supply two thousand eggs per day under fairly good conditions is not profitable. Three thousand eggs per day is only a fair average, and a good queen will often come up to five thousand.

A colony lacking sufficient bees seldom gives a surplus.

M. D. Whitcher.

How to keep boys on the farm.—The question of how to keep boys on the farm is as perplexing as it is important. The Rural New Yorker publishes the following article, which may give an idea as to a posible solution of the question:

"Many years ago I was talking with Gen. Sheridan in Chicago. He told me that when he was a major of cavalry in Arizona he was in charge, on behalf of the government. of a tribe of Indians, the Colorados, and his duty was to confine them to their reservation. His principal difficulty was on account of their nomadic character; no matter what effort he made to make their homes comfortable for them, still they would leave them and travel away, and had to be brought back by the cavalry at short intervals. He finally decided that if he could give them some interest in the way of live stock it might be an anchoring influence, so he succeeded in having the government give them a stock of horses. That, however did not answer the purpose, for they drove the horses and continued to travel with the horses and mares and colts as they had before. Then he tried the experiment of giving them cattle, but after the cows had produced calves in the spring of the year the Indians traveled, and the stock traveled with them. Finally he hit upon the idea of giving them a stock of poultry, and the squaws promptly realized the value of the product of the hens in the domestic economy, became attached to the eggs and attached to the chickens, and when the bucks proposed that they should make their summer migration, the squaws said "No." The result of the poultry experiment was that for the first time he was enabled to anchor these Indians to the place where the government desired to keep them.

There are many boys on the farm today who could be anchored to the old home if they could be interested in a good hen."

As a remedy for scours in goats, J. L. Fisher, of Kellogg, Oregon, recommends in the Pacific Homestead, the use of oil of orioto. He says: "It is very effective and easy to administer to the afflicted mohair yielder, being given in tablespoonful doses."

Chas. H. Shinn, supervisor of the Sierra Forest reserve states that the department has increased the number of sheep to be pastured in the reserve from 15,000 to 20,000.

California Horticulturally

BY JOHN ISAAC, SACRAMENTO, CAL.

EASTERN PEACH CONDITIONS.

Later reports from the Eastern peach sections are rather more favorable for a crop. In the northern sections, Illinois and Michigan, very much damage has been done by frost, and it is probable that there will be a short crop, but south of Washington there is a chance for a good crop. In a letter just received from a Washington correspondent he says: "I am pleased to say that the buds of peaches, plums and other fruits are not injured to any great extent in this section. I saw peaches in blossom from Atlanta northward, and reports are that there has been no serious damage that far south. They are hurt somewhat, however, in the South."

FUNGUS DISEASE IN THE PEACH SECTION.

Peach growers in Northern California are very much worried this season with a form of blight which many believe to be similar to the pear blight. The new leaves and tender shoots will wither and shrivel up in a day, without apparent cause, and in many cases a sticky substance oozes from the twigs or trunk. From investigations of this disease which have been made it is believed to be rather a fungus disease than of bacterial origin, and is probably similar to the shot-hole fungus of the apricot. It has been noticed to some extent in former seasons, but is much more virulent this year than usual, especially in orchards in which the spraying was delayed in the season. In orchards where the salt, sulphur and lime spray was used early in the season there is much less indication of the disease. This would seem to prove that it is of fungoid origin and that the spores were caught and killed by the early spraying before they had become sufficiently established to resist. Very many of the peach orchardists have deferred their spraying until late this season on account of the continuous rains, and for the reason that by late spraying the work of the peach worm is checked. The season has been particularly favorable for fungus growths, and is is more than likely that the general prevalence of this growth can be accounted for in this manner.

TO CONTINUE PEAR BLIGHT WORK.

On the request of Governor Pardee and Mr. Beard of the Valley Development Association, the United States Department of Agriculture, through Dr. Galloway and Dr. Wood of the Bureau of Plant Industry, have determined to leave one of their experts, Mr. Swingle, in the field until the early part of June and the infection period of this season is past. It is possible that the work will be continued in our State next season, as there has been an increase in the appropriation for this work, and California is at the present time the most important section so far as pear growing is concerned in the Union.

HEAVY RAINS DO DAMAGE TO FRUIT CROPS.

The last two weeks have brought about a decided change in fruit conditions in the upper country. Heavy and almost continuous rains have prevailed all through the blooming season, and this has had its effect on the crop. In many sections the pollen was literally drenched from the bloom, and in consequence the prospects for a heavy crop of early peaches is poor. Late peaches promise somewhat better. Almonds have been affected, and plums and prunes have suffered. It is still impossible to predict what the coming crop will be, probably fair, but early promise of a heavy crop will not be realized.

THE STATE FARM LOCATED.

At a night session of the State Farm Commission, held in the Capitol building on the night of the 5th instant, the Commission finally decided to locate the State Farm in Yolo County, near the town of Davisville. The choice is a most excellent one, as there are more advantages combined in this location than any other one which had been offered. Davisville is some 12 miles from Sacramento on the main overland road. It is the junction of the Sacramento Valley roads which run on the east and west sides of the valley. It is on the direct line of the Oregon road and within easy reach of the whole of the Sacramento and San Joaquin valleys by rail. It is centrally situated so far as the State is concerned. The site selected is bordered on one side by the Eastern overland road and on the other by the Oregon road, so that all travelers coming into the State over either road pass along it. It is consequently convenient for travel, and, with a spur built into the grounds, everything can be brought in and taken out by rail. The soil is excellent, the deep alluvium, with an admixture of sand, characteristic of most of the Sacramento Valley soil. Arrangements have been made for an abundant supply of water for irrigating, and the climate is that of interior California. Altogether the Commissioners could not have hit upon a more favorable location, and both they and the people are to be congratulated on the choice.

TOBACCO CULTURE IN THE SACRAMENTO VALLEY.

Experiments in tobacco culture have been carried on in different parts of the State from the earliest periods, but for some reason they do not seem to have met with success. Tobacco has been grown quite extensively in the vicininty of Cloverdale, and local reports credit it with good qualities. There seems to be no good reason why, with our vast range of soil, climate and various conditions, tobacco growing should not prove a great success in some sections. It has been asserted that while we can grow good tobacco, we do not understand the proper method of curing it after it is grown, and that the fault lies in the manipulation. Whatever the reason, it is a fact that while we have carried on numerous experiments in tobacco culture, it has never become a noticeable industry in our State. The matter has been brought to the attention of the Department of Agriculture, and a quantity of seed of different varieties of tobacco has been sent to the Valley Development Association, by which it is being widely distributed for experiment in the Sacramento Valley, and variety for that location may be found and this industry be established in our State. If the growing is accomplished with any degree of success an expert will be sent out to instruct the growers in the proper methods of curing and preparing the weed for market. Tobacco growing is one of the most profitable of all forms of agriculture, and it is to be hoped that the experiments now being made in our State will prove successful and open to us a new industry.

With the Citrus Growers

BY J. W. MILLS

MANURE FROM THE POULTRY YARD.

It is commonly supposed that pure hen manure is a very rich fertilizer. According to the analysis made by different experiment stations one hundred pounds of fresh droppings contain .05 of a pound of phosphoric acid, .56 of a pound of potash and 1.10 pounds of nitrogen. According to the ruling prices of fertilizers 100 pounds of such manure would be worth about 20 cents or $4 a ton.

Poultry manure has to be handled so that it will not dry out or its value will be greatly reduced. It must be borne in mind that chickens are their own dentists and swallow their false teeth at each meal. It will be noticed that the small stones and even the sharp pieces of glass that chickens swallow with their food are found in the manure with the edges taken off and rounded. This silica is disolved by the digestive process of the chicken, and part of the potash and phosphoric acid that would otherwise be free in the dried manure becomes encased in this silica when it solidifies which it does on drying, thus rendering it insoluble and consequently not immediately available.

The most profitable way to apply poultry manure is in the irrigation water. If the manure is gathered every morning and placed in covered boxes or barrels and shoveled into the irrigation furrows at each irrigation practically every particle of it is utilized.

Stable manure and poultry droppings cannot be profitably used together, as one requires to be kept moist and the other is best preserved if dried as soon as possible. Should the stable manure be kept moist it would dry out after spreading and before it could be turned under and then the poultry manure would suffer.

PROTECTION AGAINST FROST.

Five years ago extensive experiments were made in smudging to prevent freezing in the citrus groves of Southern California. The Riverside Farmers' Club did good work in collecting data on the subject. It was found that the temperature could be kept two to four degrees higher when smudging was practiced co-operatively over considerable area. Single individuals could do practically no good with smudges when the temperature got down to the danger point. This smudging proved an additional expense that very often consumed what little profits there might have been realized.

Gradually those situations which were sometimes visited by freezes which defied the smudges are changing their orange groves to some other lines of farming, and where water is abundant and cheap alfalfa has been planted. Gradually the orange groves are being pushed to higher elevations and the lower lands where once were thriving groves in certain districts are adding in other ways to the substantial growth of Southern California. The job of fighting Jack Frost is an endless one and takes away the pleasure of citrus growing where it has to be waged, and very often all the profits are consumed. These conditions are not indicative of decline or even evidence of instability in the orange business. It is merely a readjustment of the business upon a safer footing. The lessons had to be learned and some one had to learn them for the benefit of their followers.

COVER CROPS.

By the term cover crops, we refer to those plants of the legume family such as peas, beans, fenugreek, burr clover, vetch, alfalfa or other varieties which produce the nitro culture bacteria in nodules on the roots.

As a source of supply of nitrogen and humus they are of incalcuable value, being more effective and much cheaper than any other source, and are a much better form of plant food than the nitrogen derived from nitrate of soda or dried blood, which are both expensive.

In soils deficient in a supply of the bacteria which produces the nitro-culture they can easily be obtained and the number increased by inoculating or vaccinating the soil or seeds with the nitro-fixing culture which has been supplied free by the Department of Agriculture, Washington, and on land where no leguminous crops has previously grown it is always advisable to practice inoculation before planting the crop.

There are many varieties of leguminous plants adapted to the soil and climatic conditions of Southern California, and some that have given good results for use in the citrous orchards are: The Canadian Pea, Prussian Blue Pea, Smooth Vetch, Burr Clover, Lupins, Sweet Clover, Yorkshire Hero Peas for winter use and the New Era and Whip-Poor-Will Cow Peas for summer use have all been successfully tried. The Burr Clover, being indigenous to Southern California, is an excellent cover crop, as it grows well in the shade of large trees where peas would not thrive, and its roots show multitudes of nodules. As a summer crop, the Whip-poor-Will Cow Peas seem superior to the Cow Pea, having heavier tops and an unusually long tap root, specimens having been examined that show a tap root over six feet long. This is an ideal subsoiler, as it forces its roots down into the heavy soils, and when plowed under and decayed leaves a hole down which the irrigating water can soak deeper than by any known subsoiling. For use in an orchard the winter cover crop should be planted about September 15th or October 1st, and the soil should be previously thoroughly irrigated and cultivated and the ground left furrowed out in case winter irrigation is necessary.

An ordinary fertilizer drill, with the outlets sufficiently reduced, is an effective implement for sowing pea or vetch seeds.

The crop should be plowed under while the vines are green and full of sap, usually from the time the plant blossoms until the pod is formed, and always before the vines become too high to decompose quickly. One of the best implements for this purpose is a disc plow, as it will completely cover the vines in hard or soft soil with well pulverized dirt. On my own orchard I have completely covered vines of peas and clover with a disc plow that were so rank and in such masses it was impossible to use an ordinary walking plow even with rolling-coulter attached.

The benefits derived from using a cover crop are numerous aside from the value in supplying nitrogen and humus. They are equally as valuable on heavy soils as on light land, as they make heavy soil light and light soil heavy.

On light soils they increase the humus and thereby increase its beneficial effects in conserving moisture and acquiring gases from the air and render the soil more capable of retaining the other fertilizers that are applied.

One hundred pounds of soil heavy in humus will hold 194 pounds of water. A sandy soil only 25 pounds to 100 pounds.

On heavy soils the large amount of green matter in cover crops when plowed under has a tendency to divide and lighten the soil by its mechanical action, and its fermentation produces chemical reaction that decomposes the minerals in the soil.

Cover crops are also of value in making the potash in the soil better available as plant food.

One prominent orchardist of Riverside has an increased production of "fancy" fruit each year as a result of using cover crops.

A Covina grower never has coarse or puffy oranges when he grows a cover crop. Mr. J. B. Neff of Anaheim finds it materially reduces his irrigating expenses on his walnut orchard. Nitrogen and humus we must have, and in no other form can they be secured as economically and as well adapted for plant food as in cover crops. In selecting a cover crop one should endeavor to learn by experimenting which is the best variety for his soil and locality and watch carefully the development of each kind tried.—B. F. Thorpe.

Smooth, Thin-Skinned, Solid, Juicy

ARMOUR'S BLOOD BONE AND SINEW FERTILIZERS

oranges can be raised as easily as coarse, puffy fruit. The first step is the judicious selection of fertilizers.

The Goods Behind The Shield

enable you to avoid the necessity of experimenting with fertilizers. Their reliability has been demonstrated, both in the laboratory and the orchard.

And all the leading varieties of Orange, Lemon and Marsh's Seedless Grape Fruit Trees for sale. Are principally two years from bud and very fine. Can furnish from my nurseries at Glendora, Riverside or Redlands, as desired. Address

Redlands Nurseries, E. I. Martin, Prop., Redlands, Cal.

CITRUS TREES

20,000 late Valencia and Navel Orange, Eureka lemon and Seedless grapefruit 1, 2 and 3-year buds. All stock first-class in every respect.

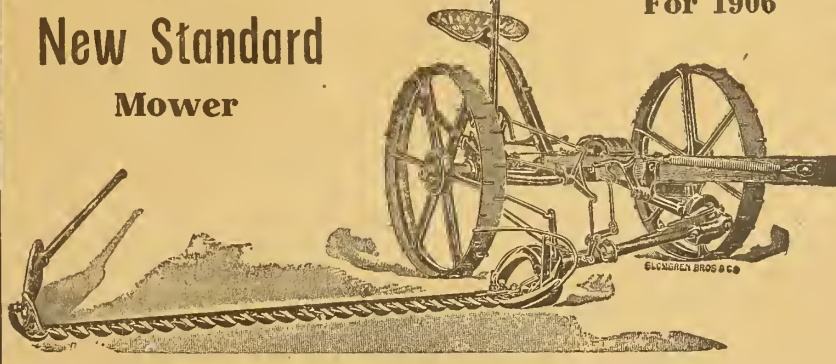
POLLARD BROS.,
ALHAMBRA, CALIFORNIA

10 per cent gross on every car is being saved by growers using the new patent Cyclone Car Cooler (Famous Intermittent Vacuum Method). Address today

Chas. F. Edson, Manager Citrus Cooling Company, 950 West 20th Street, Los Angeles, Cal.

The New Standard Mower

For 1906



High Wheels with Special Removable Clutch Boxes. Wide Frame. Roller, Brass and Ball Bearings. Three Motion Gear with 22 Cog Gear Clutch. Curved Cutter Bar, Suspension Spring and Compensating Lever. Reversible Guard Rails. Separate Hand and Foot Raising Levers. Descriptive Circular sent on application.

Newell Mathews Co.
200-204 North Los Angeles Street
Los Angeles, California

ORANGE TREES

Oldest Established Citrus Nursery in California, at Alhambra, Los Angeles County

Late Valencia and Washington Navels, Lisbon and Eureka Lemons. Guaranteed true to name. No better trees in this State. Lowest market price. Three-year buds, four-year roots. Horticultural Commissioner's certificate. Order early, as good trees are scarce. Inspection invited.

E. G. Wood, Owner, at Nursery or Room 732 Huntington Building, Los Angeles, Cal.

The Ornamental Garden

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

ETHERIZING PLANTS.

Some curious and successful experiments are now being made in Europe with ether, the object being to ascertain whether it can be used to advantage for the purpose of forcing hothouse or other plants. The ordinary course is to wait until the first frost has stripped the leaves from the plants, thus permitting them to take for a season that repose which all living creatures need. If vegetation could be arrested and repose begun sooner, it is evident that the plants would blossom much earlier next season, and this is precisely what the experiments with ether are designed to accomplish.

The ether employed is the sulphuric or etylic. When applied to plants it acts on the nutritive and other materials which are in their vessels during the period of active life, from March to October, and thus arrests the circulation of the sap.

If a phial of ether is placed under a lilac, an azalea, or any other plant of a similar nature the vapor of this very volatile liquid will quickly envelop the branches and will thus cause the leaves to fade, and at a given moment will arrest growth in the same manner as frost arrests it. In other words, ether shortens the period of vegetation and produces the same effect as the first frost.

The best results with ether can be obtained between July and the beginning of September. The plants to be treated should be placed in a dry room, or, better still, in a box which is entirely closed and the temperature of which is not too low. The ether is poured from outside into a vessel which is hung within, and the opening must then be promptly closed so as to avoid any waste of the vapor. This operation should be done during the day, as ether is highly inflammable.

CARE OF POT PLANTS.

Turn your plants in the window to prevent them from becoming one-sided. Do this at least one a week. Keep them perfectly clean at all times If cleanliness is next to godliness among men and women, it is next to healthfulness among plants. Indeed, plant health is largely dependent on it. Leave decaying foliage on a plant, and let dust clog the pores of it, and vermin breed at will, and in a short time you will have a plant hospital to run. Stir the soil to prevent its becoming crusted over. If the pots show green mold on the outside, scour it off promptly, and examine into the condition of the drainage. If this is what it ought to be, few pots will become moldy.

A FINE COLEUS.

Coleus thyrsoides is a new departure among coleus by being a desirable flowering plant. It more resembles a salvia than a coleus, producing long spikes of quite showy blue flowers.

THE CHRISTMAS ROSE.

The good, old fashioned, "Christmas rose" (Helleborus niger) is almost a total stranger in California, though why it is hard to say. Although they thrive best near the coast, where they can get the sea air, they do well anywhere if not placed where the hot mid-day sun can get at them.

GENERAL CULTURE OF CACTI.

The members of the cactus family are exposed to widely different temperatures in their native habitats, owing to the extent of the American continent over which they are distributed, but also the great elevation on the mountains of those regions at which some are found, and it is principally in regard to heat that the treatment of cacti has to be varied. A large number, probably the majority of known species, frequent the desert-like plains and the rocky, volcanic districts of Mexico, where they grow and flower under the fiercest tropical heat, not only uninjured, but positively luxuriating in the burning rays of an unclouded sun. There for the greater portion of the year the soil is parched and the atmosphere dry, and no other plants can exist except those which have become either resembling their cactus neighbors in developing a succulent growth containing an abundant store of fluid support, or possessing foliage protected by a thick impervious, leather-like epidermis, which effectually enables them to withstand the rapid evaporation constantly proceeding in such regions. It is not easy to reproduce these conditions artificially when cultivating the plants in our climate; we can, however, insure a sufficiently high temperature with the requisite aridity of soil or atmosphere and this seems all that is needed, though undoubtedly the maturing effect of a roasting sun is missed to a certain extent.

Nearly all the family need a free exposure to the sun; but even amongst the tropical species there are exceptions to this rule, for Rhipsalis and Epiphyllum, being epiphytal in habit, succeed well in moderate shade and can indeed be associated with such moisture-loving plants as orchids and ferns.

THE INDIAN LOTUS.

The lotus, botanically known as Nelumbo, is a plant of such remarkable interest and beauty that it must be give more than a passing word. Writers who have made its history a study state that it no longer grows wild in the Nile, and perhaps was not a native of Egypt. It seems to have been revered in India as well as Egypt, from the dawn of history; and it is not impossible that it traveled from the former country, where we know it is indigenous to the banks of the Nile at a time so remote that even the Egyptians of the earliest historic dynasties may have believed in its local origin. In these later days it has proved itself to be equally at home on the western continent. The lotus has been naturalized in California, one instance being in East Lake Park, Los Angeles. As to its culture it prefers a heavy soil well enriched. It may be grown in a large, shallow wooden box submerged in a fountain; or a more liberal space may be given to it, in proportion to the size of your basin or pond. The roots are tuberous, and shaped like bananas. If it is desired to transplant them, it should not be done until the growing season arrives. There are eight or ten varieties in cultivation here.

The Egyptian lotus has rosy petals, shaded to a white at the base.

Nelumbo roseum plenum is deep, rose red, full and double, like a peony or the rose Paul Neyron.

Nelumbo album plenissimum has pure white flowers with one hundred petals.

CALIFORNIA OAKS.

Our readers may have some interest in a brief description of the oaks native to this State. We have many that are worthy of a place on every farm and some would adorn any city garden.

1. Quercus agrifolia. Field oak, 'Eneena." Central and Southern California, 20-40 feet.

2. Q. Breweri. Brewer oak. Bush or small tree, western slopes of the Sierra Nevada, from northern part of state south to Tulare county, 12-18 feet.

3. Q. Californica. Kellogg oak. Black oak. West slope of Sierra Nevadas for nearly the entire length of the state, sometimes a low shrub but often 80-100 feet.

4. Q. chrysolepis. Golden leaf oak. Maul oak. Found quite generally throughout the state, mostly in canyons; has two distinct varieties; var. Palmeri, and var. vaccinifolia, from a scrub to a tree, according to locality 20-40 feet.

5. Q. densiflora. Tan-bark oak. Chestnut oak, from northern boundary to Santa Ynez mountains, Southern California, on the coast ranges, in some places but a few feet high, and in others 40-60 feet.

6. Q. Douglasii. Douglas oak. Blue oak. Central California, 20-30 feet.

7. Q. dumosa. Scrub oak. From San Francisco, south to the San Bernardino mountains, and on the Channel Islands, where it often becomes tree-like, in both habit and size. North of San Francisco var. revoluta is the common form.

8. Q. Engelmanni. Engelmann oak. Confined to a narrow belt 50 miles wide in Southern California. 40-60 feet.

9. Q. Garryana. Pacific post oak. Northern California, near the coast. 60-70 feet.

10. Q. lobata. Valley oak. The monarch of the family in this State. Valleys of Western California from Redding south to Tejon Pass. Often found with trunk nearly 20 feet in diameter. Top nearly 200 feet across, and often over 100 feet high.

11. Q. Sadleriana. Sadler oak. A scrub oak, forming thickets in a limited region in Northwestern California. 3-6 feet.

12. Q. Wislizeni. Live oak. From the slopes of Mt. Shasta to southern line on Channel Islands. Trunk frequently 4-6 feet in diameter. 50-80 feet.

Fodder does not make a very good food for the horse, it being too rough. Hay or straw is better for winter feed.

We sell country lands. CHATFIELD & VINZENT, 228 Montgomery St., San Francisco, Cal.

Sycamore Grove Nurseries

We do Landscaping in all its branches, but also carry a full line of Ornamentals and Fruit Trees. Several different varieties of Acacias and Eucalypti. Send for our prices.

In the Vegetable Garden

BY ERNEST BRAUNTON

THE PEA FAMILY.

Representatives of the legume family are found in all climates and countries. The pea and bean grow rapidly, three to four months being sufficient to bring most varieties to maturity, and consequently they can be grown in the short summers of far northern lands, the pea, the most hardy of them all, at least as far as 67 degrees north latitude; and, as they also stand high temperatures, they are largely cultivated in tropical and subtropical regions. The pea is the favorite legume of middle and northern Europe, while in the Mediterranean countries the bean is grown more generally than the pea. In nearly all sections of our own country both the pea and bean are grown extensively, and are even exportel. Peanuts of a superior quality are cultivated in California and the southern states. So far as can be learned, the lentil is at present grown in this country only to a small extent in the southwestern portion of the United States.

SUMMER BLIGHT OF TOMATOES.

Under the term of "blight" is commonly designated in California a tomato disease which is known everywhere in the State in greater or less abundance, and occurs not infrequently as the cause of losses up to 100 per cent of plants between half-grown and maturity. This is here termed the "summer blight," to distinguish it from another disease to be described later. The disease seems to have been known longest in its severe form in the San Joaquin Valley.

Losses of entire fields of good-sizel plants have been known there for several years, and in fact this has come to be almost the rule in that section. In Alameda and Santa Clara counties the disease has frequently been seen on occasional plants, but has not been considered of any serious importance. In Southern California this blight has been the cause of considerable loss in recent years. In 1905 the disease was probably more general than ever before, completely ruining many fields in Southern California, almost all in the San Joaquin, and causing a loss of from 1 to 50 per cent of the plants in fields all over the State.

Pending further investigation of this disease, little can be said concerning methods for its control. Great care should be taken to make the seed-beds of absolutely new material, and to plant the field where the disease has not occured. Spraying the tops is perfectly useless, since the trouble is entirely below the ground. Experimental plantings are planted for this year, on infected and new soil, both in the seed-bed and field, and on sterilized soil. Methods of soil treatment will also be considered. The matter of resistant varieties is also worthy of some attention, particularly in selecting seed from resistant plants in fields where the disease is abundant.

GARDEN FERTILIZERS.

Most soils are benefited by the addition of humus, a name applied to any thoroughly rotted vegetable or animal matter. Humus may be known by burning a small quantity of soil on a red-hot shovel. If it gives an odor of feathers, it must contain humus from animal matter; if an odor straw, it contains humus from vegetable matter. Humus forms the richness of nearly all good land, and rarely is there too much of it.

In close-grained, sticky soils, which have a tendency to bake, the humus produces a looser texture and a better balance in the retention of moisture. On a loose and leachy soil it brings the grains closer together and promotes chemical activity. At the same time it supplies plant food. Leaves, garden refuse, and barnyard manure made into a compost and allowed to decay make good humus. The pile must be turned over several times each year until it is thoroughly broken up into a mass of even texture.

Lime may very often be added to a soil with good results. It corrects acidity, makes clay soil more friable, and holds sand closer together.

MULCHING VEGETABLES.

Whether mulching shall be used in a particular case depends also upon the vegetable to be grown. Early spring vegetables requiring only a few cultivations can usually be grown more cheaply by cultivation than by mulching. Furthermore, very early mulching, before the ground has become thoroughly warm, is apt to retard the development of the vegetables.

On the other hand, summer or fall vegetables that require frequent cultivation throughout the season are grown as a rule with less labor by mulching than by cultivation. Furthermore, the mulch can often be spread at a time when other farm work is not especially pressing. If cultivation alone is depended upon, the garden may be cared for well enough early in the season, but is almost sure to be neglected later, when the rush of summer's farm work is on and when, owing to dry, hot weather, the need of proper care is most imperative.

The fact that most vegetables, especially the more tender kinds, cannot be mulched until they have become well established and the weather has become warm, thus requiring some preliminary cultivation, certainly increases the labor required in growing mulched vegetables over what would be necessary if the mulch could be applied earlier. But, if the impracticability of early mulching is a serious drawback to the use of mulches, so is the impracticability of mid-summer cultivation under farm conditions a serious objection to dependence upon cultivation alone. For most vegetables, mulching should be used to supplement cultivation rather than displace it. Such cultivation as is commonly given farm gardens is better for most vegetables in early spring than mulching, but mulching is just as surely better in midsummer than the neglect which is the common thing in farm gardens at that time of year. The Experimental Station tests have indeed shown mulching to be better in many cases than the most thorough cultivation throughout the summer.

Not only are many vegetables grown with less labor by mulching than by cultivation, but the yield and quality of the product is often improved. In several cases yields have been decreased by mulching. In some of these cases, however, the injury was due not so much to the use of a mulch as to its being applied too early.

A Boston entomologist makes the statement that bugs, under which name he includes all insects from the grasshopper to the ladybug, are destroying property in this country to the amount of $250,000,000 a year. This corroborates the investigations of the Agricultural Department, who find that twelve insects, principal among which are the chinchbug and potato beetle, destroy annually not less than $100,000,000. Truly the insect, small as he is, is more dangerous to the human race than war.

"Have you anything that will remove wrinkles?"

"We have some fine jackplanes, ma'am, that I think would do it."

"Mercy, isn't this a drug store?"

"The drugs are over there by the soda water fountain. This is the hardware counter, ma'am."—Cleveland Plain Dealer.

EVERYTHING FOR THE LAWN.

The Peter Henderson Co., 35 Cortlandt street, New York, issues an instructive catalogue, "Seeds and Appliances for Lawn Making." At the beginning are a couple of pages of general information regarding the formation and care of lawns. It is an interesting booklet and worth having.

Agriculture As a Profession—Dr. George E. Vincent, professor of sociology in the University of Chicago, who enjoys a national reputation, gave an address to the students of the University of Utah last week, in which he took occasion to commend the profession of farming as one of the most progressive and dignified in the catalogue of modern scientific development. In the course of his address the Desert Farmer says he stated "that agriculture, instead of being a matter of disdain is to be made a profession, for which a man will have to be as carefully trained as is the lawyer or mining engineer of today." To some people such a radical change seems impossible, but when they consider what has been done by putting technical skill into other lines it is made more clear.

Continuing, Dr. Vincent said: "A good example of what the professionalizing of an occupation can do toward building up an honorable social type is seen in the contrast between the social position of the trained nurse and the domestic servant. The trained nurse's work is is many respects more menial than that of the servant girl, but science has made her trade skilled and highly technical.

"This will be the effect upon the business of farming. Whenever the farmer makes his calling highly technical and it becomes a profession, requiring only highly trained men to succeed, then the long standing prejudice against farming and in favor of a business training will be smoothed away.

"Agricultural experimental stations must be established in many places throughout the country and the public school system must be brought in harmony with the university training. This is to be done by establishing model farms in or near all the schools so that the children may study agriculture from a more practical standpoint."

This point well deserves the careful consideration of the public, for it has come to be acknowledged as a living fact that the theoretical elements of education should be combined with practical operation. It is this fact which the public recognizes and it is for this that our universities and schools of higher grade are seeking to establish small model farms, or plots of ground where students may put in practice out-of-door what they are taught in the class-room. The time will come when this idea will obtain even in Union High schools, because of its practical demonstration of book education taught in the classes. We look before long, to see prominent educators of the country endorse this plan. It is the first of the many great steps that all our advanced schools in the land must take to carry out the necessary evolution in educational systems.

* * *

The University Farm—On the 5th of this month the commission appointed to select a site for the University farm, decided to locate the farm at Davisville in Yolo county. The Cultivator is not familiar with this particular point nor with the advantages it offers, but Prof. E. J. Wickson, expert of the University Farm commission is, and in an interview on the subject he makes the following statement.

"The selection of the Davisville site for the University farm is eminently wise. At the close of my first examination of the farms offered, I considered it as the most available because of convenience of access, means of frequent communication, prominence through proximity to main overland and local railway lines and because it so fully answered the requirements and because it is so thoroughy representative of wide interior valley conditions. There can be no question that the law passed by the last legislature contemplates just such a situation and in their action the commission has directly carried out the law.

"In my report to the commision I took into account some other considerations which led me to commend other sites as alternative with that at Davisville. One of the other Yolo county site near Woodland seemed to me to stand first because so many excellent buildings would be acquired with the land and the utilization of them would save time and money in opening instructional work on the land. Another site which was commended, chiefly because of proximity to the university, was the tract near Walnut creek, but it was for the commission to decide just what weight should be attached to proximity. It is possible that the confusion of interests in Contra Costa county may have obscured the claims of that site.

"The fact remains, however, that Davisville is chosen as the most available from all points of view and most thoroughly representative of irrigated interior valley conditions which the law contemplated. It is fortunate that a decision has been reached and that the university can proceed with the equipment and utilization of this the most important single contribution which the state has ever made to the development of agricultural education. It is fortunate, also, that the commission has answered what seemed the clear, popular demand that the location be representative of the greatest open area of the state, rather than convenient for the university. Convenience to the university is in fact a matter which should not be too narrowly considered. The university is, and should be, at home everywhere in the State. A grand institution which is studying stars from the top of Mount Hamilton, studying marine line at Pacific Grove and San Diego bay, studying trees at Chico and Santa Monica, studying plant diseases in the Sacramento valley and at Whittier, studying fertilizers by use of land at half a dozen widely separated places in Southern California, studying plants and the use of them everywhere that the university investigators can find places to grow them, killing insects at Visalia, San Jose, Concord and Watsonville, and studying the growth of grapes and the making of wine in San Joaquin and Fresno counties—surely an institution thus localized and distributed in its work can find a home for one of its activities in such a central and accessible district as southern Yolo county."

The University of California should not be centralized. It should do everything it can for the people in the place where it can be best done and such a course will make it solid with the people. The commission has reached a decision for which every one should be thankful.

* * *

Good Fair Promised—Now we get the information that the directors of the State fair are going to give the people of California a genuine, allaround fair, in which all sections of the state are to be recognized.

A correspondent from Sacramento, writing the Cultivator on the subject, says: "The reference made to the State fair commission in the Cultivator recently was timely, the criticism just, from the standpoint of past experience, but we are glad to say no occasion will be required for a repetition of the same because the directors have decided to give the people a cosmopolitan fair this year."

This is refreshing, certainly, and we shall hope and trust the prediction made by our correspondent will be verified, and that we are really going to have a State fair this fall which will represent not only the peculiar district in which Sacramento lies, but the whole of the State.

Hitherto California as a whole has not enjoyed a distinctive showing at any of these exhibitions. Its representation has come at other fairs, for we have had no inning at the State fairs.

Nor have these fairs been really fairs at all: simply a large horse-race with a few pumpkins and pigs and gentemen cows attached for the benefit of the farmers, but of no real value to the farmers as a class.

If the promoters will now go to work to interest the whole State, the agriculturalists, the stock raisers, in particular, we may see such a exhibition as California has never witnessed. Let it be so.

San Dimas Citrus Nurseries

Orange and Lemon Trees

Are the only kind of nursery stock we have grown for the past twenty years, and being the largest producers in the world we feel that we are in a position to render intending planters better service in the way of superior trees over all competitors. Our prices are right, considering quality.

Good Trees mean Good Profits

A poor tree is expensive as a gift, and an untrue-to-name plant an aggravation and waste of time, labor and money. When you plant an orange grove remember Davy Crocket's advice, "Be sure you are right, then go ahead."

We stand ready to prove to you that you will be right when planting our trees. Correspondence a pleasure, and our booklet on Citrus Culture is free.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

Last week with the exception of a few cars, finished the navel orange crop in Highland.

A considerable acreage of orange orchards about Monrovia, particularly in the lowlands, has been changed from oranges to walnuts.

The Highland Orange Growers' Association finished their last car Wednesday last, and from now on will be busy with a few cars of sweets and Valencias only.—Messenger.

The board of supervisors in response to an appeal of the fruit growers of Pajaro valley, has granted an appropriation of $600 to continue the crusade against the codlin moth.

The condition of the fruit crop around Marysville is in doubt. Most of the orchardists report that almonds are all gone, apricots nearly so and peaches more than half destroyed.

A Fresno dispatch says: There is a prospect of a big shortage in the peach crop. In the San Joaquin valley the ravages of the blight are expected to reduce the yield one-third

Investigation among growers here today reveals the fact that some of the orchards that were sprayed with lime, sulphur and salt, and some with an oil emulsion, are badly affected this year.

Inquiry for orange groves around Monrovia has been heavier the past few weeks than for years, stimulated, it is believed, by the good prices obtained for the fruit in the Eastern market.

What at first seemed to be a very promising season now looks like one of poor crops, and the only consolation at hand is in the hope that the price will be greater on account of the shortage.

The Colton Fruit Exchange has just paid a dividend to its growers for all fruit received during the month of February. It amounts to 2 cents a pound for all navels received at the packing house.

The deciduous fruit growers of the Eastern states are threatened with a light crop this season. The warm weather in February started the buds and the stretch of March winter froze them off.

A hundred cars of oranges blocked by the slide on the S. P. between the Tehachapi and Bakersfield had to be shipped back to Los Angeles last week, re-iced, and sent north again over the Coast line.

This has been an unusually big year in the olive business in the San Diego section. For several weeks J. C. Kubias, who has handled most of the olives grown there, has been sending away from two to three cars a week.

The condition of the peach orchards here in general, has become a matter of concern, says the Hanford Sentinel. Last year the disease attacked the peach trees in the Suisun country, and the orchards are not as bad off this season as they were last.

It is believed by many that the present year will be the greatest in the history of California for the citrus industry. It is confidently believed that growers will bank from $18,000,000 to $20,000,000 after all expenses of freight and icing charges are paid.

In no section of the county will there be a full apricot crop, and in most sections there will be no crop whatever worth considering. Like last year the crop is badly spotted, only more so.—Ventura Free Press.

The price will probably be higher as the supply is reduced.

The Hanford Sentinel says: The Kings county raisin growers have united with the Fresno growers to investigate the association books. There are between thirty and forty growers in Kings county, and perhaps 300 or more in Fresno county, who have pooled their interest in the investigation matter.

The Riverside Press says: The navels are pretty well cleaned up at Redlands also; those who have any quantity of this variety left are certainly in clover the way prices are running at present. Riverside has 700 cars or more to ship and they are worth from $500 to $600 per car net to the grower, or $350,000 to $400,000.

At a meeting of Dinuba raisin growers, held last week, a pool of one thousand tons of fruit was sold under three-year contract at 3¼ cents to packers. This is the first contract, it is claimed, for a large amount made by packers for over a year and indicates the activity that characterizes the market and the prospects for still higher figures.

Prof. Albert Herre, head of the biological department of the San Jose High school, has recently been honored by the publication of a work of his on the lichens of the Santa Cruz peninsula by the Washington Academy of Sciences. Of the estimated 300 varieties of lichens found in this section of California, he has investigated 250 varieties, and is now at work on the others.

AGRICULTURE.

Fullerton shipped last Thursday, a carload of cabbage, 137 crates, which netted the grower $30 per ton.

Our wheat farmers say that the stand of grain this year at this time is in better condition than during any years since 1884.—Lindsay Gazette.

Cabbage growers in Orange county are jubilant over the present outlook. The acreage this year is unusually large and the quality is all that can be desired.

The Lindsay Gazette says: Cantaloupe planting has commenced in the Lindsay district and the present prospects are that quite a large acreage will be put out.

The Walters flouring mill at Pendleton is spending $17,000 to increase the capacity of its plant from 100 to 500 barrels per day. The wheat crop promises to sustain the venture.

Hop growers in this part of the state are agitating a movement to reduce the acreage of hops, believing by this means better prices for the product will prevail. Over-production was responsible for the low prices that prevailed for two years.—Pajaronian.

Farmers around Corcoran, Kings county, are rejoiced at the copious rainfall that has visited that section this spring. It is the general opinion that the crops will be a record-breaker for that entire district as the ground has been put in fine condition and will require little irrigation.

LIVE STOCK.

Asher & Falkenstein of Anaheim shipped last week 1,200 dozen eggs to Los Angeles. The market price here is now down to 18 and 19 cents a dozen.

The New Era of Corning reported last week the shipment from that station of 8,000 pounds, or four tons of dressed turkeys, 40 dozen chickens, and 1,350 dozen eggs.

Oregon's wool crop this year will aggregate about 17,000,000 pounds, a slight gain over 1905, according to E. H. Clark, a woolgrower of Pendleton, in an interview in the Oregon Journal.

Two hundred Angora goats perished in the storm of March 27th, while being driven from Manton to Chico. There were 2,000 head in the band, and before shelter could be reached they became chilled in the snow and sleet. The animals have a value of approximately $4 per head.

The supreme court has just made a decision that butter may be sold without marking weight on the label. The court holds that the law is unconstitutional on the ground that it is an unwarranted restriction on the citizen's constitutional right to his property.

A three-legged colt was born at Gonzales, in Monterey county, this month. The left front leg is absent and there is a small lump of skin extending from the shoulder about two inches in length. The colt is strong and manages to hop about on its three legs with apparent ease. It can lie down and get up alone and is a rare curiosity.

The most serious pest in California is the potato worm. The damage to the potato crop in Colifornia, as estimated on a basis of opinions obtained from a large number of growers and dealers, aggregates in some years fully 25 per cent. In one section where some of the finest potatoes are grown, the Salinas valley, the dealers estimate that at times the loss has gone as high as 40,000 sacks in a single year.

Robert E. Foster, Jr., of Newton, Sussex county, N. J., an ornithologist and biologist, has succeeded, with the assitance of his white Leghorn roosters and hens, in developing an egg with a handle. On the small end of the egg is a protuberance from the shell about as big as the handle of a tiny demi-tasse. The butt of the egg is flattened, so that the egg stands by itself. Mr. Foster is reaching for a higher triumph. He is adding, gradually, whisky, sugar and nutmeg to the water his Leghorns drink. He expects soon to ship eggnogs by the crate.

MISCELLANEOUS.

Visalia now has a popualtion of over 4,000.

Plans for a pickle factory are under way at Santa Ana.

There is a land boom northeast of Lindsay, Tulare county.

Pomona has inaugurated a movement for a municipal water plant.

Vacaville has authorized the issuance of bonds to the amount of $25,000 for a sewer system.

The sheepmen of Tehama County have organized an association to fix prices on wool and cut out the middle men.

The Porterville Messenger states that Tulare Lake can now be seen from the hills back of that town when the day is clear.

Frank E. Shaw and associates are about to bore for oil and gas east of Long Beach. They will go to a depth of 1500 feet if necessary.

The Imperial Creamery received Sunday an extra order for 5000 pounds of butter from the Cananea Mining Company of Cananea, Mexico.

While hiving some bees near Tulare, S. F. Hoover was so badly stung that he became unconscious and for a time his life was despaired of.

Live Stock and the Dairy

BY MRS. MINNA E. SHERMAN, FRESNO, CAL.

INSTITUTE NOTES.

At El Cajon, two new silos had been built and filled for the first time. In one case the silage had been made very wet and was not so perfect as in the other case, where it had not received additional water. While I have always used water freely, yet I have always considered that the ripeness of the corn would have considerable influence on the amount that was proper. In Fresno the atmosphere is very dry and at the time of filling the silos, corn cut even an hour, has lost water by evaporation. Now in damper places, or with less perfectly ripened corn, much less water would answer. So the silo builder will have to use his judgment about this matter. I think that in a great state like California we can hardly expect one way to be the best. East locality must find for themselves which is best. Now in the above cases it was probably the condition of ripeness. The greener corn probably had enough water already in it, while the drier corn needed it to help exclude the air. The water is in a measure a mechanical help in this way. The change of the cut corn into silage is said by some to be chemical; by others to be caused by an amide a bacterium, that starts fermentation, and is then destroyed by the heat. Now, if there is abundance of water it is absorbed by the corn, heating and cooking it, sending steam through the mass to raise the temperature uniformly. All the oxygen not burned up as heat is pushed upward by the slowly settling down of the heavy carbonic acid gas, and the corroding, oxidizing or burning action of the air is checked.

Another question was asked: Why did the silage shrink from the sides and admit air to spoil the silage? Now I had never had this trouble and could only repeat that we keep the edges higher during the filling and tramp it well; also that when the filling is completed we level off all over the top and tramp it well, center and sides. Now if it is desired to hold the silage for several months, straw or foxtail and alfalfa hay is used for a cover four inches deep over the top. This is also well wet down. It at once starts to grow and the plants sending down roots makes an airtight mass quickly that the air never penetrates.

* * *

Three cases of abscess of the throat and jaws were also discussed. As in none of the cases the swelling was attached to the bone, they can only be considered as a local trouble and not lumpy jaw. The best thing is to cut them so as to give free drainage, avoiding anything like a sac to hold pus; then keep the opening clean. Usually the trouble is found either to be a foxtail or barley beard and the abscess is caused by the beard working out. This makes the trouble.

* * *

The lack of care of milk in the house often makes it impossible for a dairyman to give his customers satisfaction. The following story is told by one of the university professors: He had been selling a little milk to a neighbor. This went on satisfactorily for some time, when the complaint came that the milk soured too quickly. The cow owner cleaned up carefully, sterilized all the milk containers and then found he had consumed so much time that delivery time was later than usual; so he took the milk over to the neighbor personally. Knocking at the kitchen door the maid opened it and the professor said: "Here is the milk." A pitcher was hastily emptied and dashel into a dishpan half filled with soiled water, given "a shape, a rinse and then a swipe;" with a half wet dish towel that still left the inside moist, and handed the astonished man as a fit container of his carefully handled milk. This happens every day, for I find that fully half the people take a bowl used in cooking and empty the bottled milk into it, and then let it stand until convenient to put into the refrigerator. The refrigerator in the average house is simply a receptacle for everything in the way of table scraps, and there they remain until convenient for the cook to either use or throw them out.

* * *

The old question of salting cattle comes up constantly. Now salt is cheap and a lump of salt should be placed within the cow's reach. It is better to provide it and not have it used than to have animals go without if they desire it. Cows, like "Mrs. Basley's hens, must be comfortable to do well.

* * *

The mother's ask why they have little brushes of fever in their bottle-fed babies. They are careful to pasteurize the milk just as the doctor orders. Now this trouble comes largely from destroying by heat of the natural lactic acid in the milk, and the simplest remedy is to give baby a small quantity of orange juice, beginning with a few drops in a teaspoonful of warm water and increasing the quantity as the child craves it. The natural orange juice or scraped apples is better than citric acid from the drug store, in that it is in a form that diffuses itself over the stomach rather than falls in one place or spot on the tender lining.

* * *

The single best feature of this series of institutes seems to me to be the emphisis placed upon the deep rooting of trees and doing so by placing the food deep in the soil. I have for a number of years wondered how the average farmer of Southern California could do his work with the small horses he possesses. The need of 1400 to 1600-pound work horses is great. Horses of this size will stand up under their work and come out at the end of the season in fair condition. The horse rasonably fat does not gall on the shoulders like one reduced to a skeleton. I found at Covina a span of Percheon grades I sold a month ago. Now this pair weighed about 1640 each and were raised on the ranch. The man who purchased them saw them being shod and purchased them and two others for $1000. That was a good bargain for him and good gain for us, as these horses grew up on the ranch while their dams worked and they were sold from the plows without any fancy training or fitting for market. The farmers are evidently coimng to see the value of animals that will pull at the plow as three or four of the smaller ones and eat no more, wear out less shoes and harness and come out of the plowing ready to work on the road. I have owned many spans of horses that never had a day off work when there was work to be done. From the time they were broken until they pass away horses whose health is good and who never work harder than their strength last a long time. Why? Because they are over the average in strength for the ordinary plows and wagons there is always reserved strength to be called on. So the animal is never strained. Why this is not considered in horses I no not understand, for no one ever lays in machinery or boiler of exactly the same horse-power as the engine. The six or eight horse-power boiler is used to run the four horse-power engine—to have reserved force for extra needs. The man of reserved force is the man that can rise to an emergency, and the tree that has deep roots has also force to meet the requirements of extra droughts or undue heat of the summer. So let the horses be considered and not worked every day to their maximum strength. By having them above the actual daily demand there will be strength for years of usefulness.

If the consumption of mutton increases as it has in the past ten years or even five years there will be no danger of getting an oversupply

U.S. Separator skim-milk makes stock pay
PAYS DOUBLE PROFIT

U.S. Cream Separator

Osceola, Ia., Jan. 15, 1906.

After trying different makes of cream separators I decided to buy a U. S. as it is the easiest to clean, built most solid, and I believe will last me as long as I live. Have had my separator over two years, and it has made me **$20.00** more a year **per cow** than I made before. I figure that my calves raised on U. S. Separator skim milk pay for keeping my cows.

The cream is clear profit. I make over **$40.00 a cow** clear a year. I don't feed any grain, so I consider I am doing well. If I didn't have over 12 cows I believe I could get good interest on my investment if I had paid **$500.00** for a U. S. Separator. I keep books, so there is no guess-work about it.

T. G. Armstrong."

What the U. S. has done for Mr. Armstrong it will do for you. Write **now** for a copy of our big handsome 1906 U. S. Separator catalog which tells **how** and **why.** Address—

VERMONT FARM MACHINE CO., Bellows Falls, Vt.

50% MORE CREAM FROM SAME COWS

Don't accuse your cows of being unprofitable. Give them a square deal and they will pay you well. If you are not using a centrifugal cream separator from 20 to 50 per cent of your cream is thrown away with the skimmilk—just wasted—and the cows accused of not earning their feed. In addition your own time and labor are being wasted. Why not get a **DE LAVAL** cream separator, stop these leaks, and double your profits. A **DE LAVAL** machine may be bought upon such liberal terms that it will more than earn its cost while you are paying for it and still be good for 20 years more of clear profit use. As compared with other separators the superiority of the **DE LAVAL** is seen in the fact that over 700,000 **DE LAVAL** machines, ten times the number of all others combined, have been sold to date. You may have ample trial of a **DE LAVAL** free of all cost. Now is the time to get a **DE LAVAL** while cows are making the largest product and savings count biggest.

DR. VON BEHRING'S BOVOVACCINE AS AN IMMUNING VIRUS.*

*The spread of tuberculosis among cattle in this country and the consequent loss it entails, as well as the danger mankind meets from diseased milk, leads The Cultivator to publish the following remedy which is attracting general comment.

"If a man can be immuned against smallpox by inoculation with living cowpox bacilli; if cattle can be immuned from anthrax with similar methods, even if anti-toxines, the product of pathogenic bacteria, do mitigate the ravage of a communicable disease, and also if a toxine is serviceable as diagnosing infectious and communicable disease in cattle, surely we must feel that this theory has a strong foundation to rest upon. It is the function of the medical art to not only cure disease, but to take such means as will alike prevent its propagation. Tuberculin can serve but one purpose. It will unquestionably tell us of the existence of tuberculosis, but it in no way points to its extermination. The idea that all cattle reacting from tuberculin should be slaughtered is not sound in theory or practice, but up to the present time this idea is largely in vogue. I believe we are now about to enter upon a larger conception of a large question. The step of positive diagnosis has been taken. To lessen the disease or extinguish it, is the next step. The latest investigation offers a virus as the means to be taken for this accomplishment. About 1891 Professor von Behring of the Marburg Institute, began an experiment with bovine and human tubercular virus. The extensive experiments carried on by Von Behring cover every phase of the work accomplished along this line, and show that the method insures results.

The inoculating virus which Professor von Behring has named "Bovovaccine" consists of living human tubercle bacilli, whose action has been accurately tested. The tubercle bacilli have dried without losing their vital powers in any way. These dry tubercle bacilli, kept in sealed glass tubes, will retain their action on cattle unchanged for a period of thirty days, after which time, although the immunizing power is not entirely lost, it has become so weak as to render it ineffective in the dosage recommended.

"For the injection the Bovovaccine is uniformly mixed with a freshly boiled and cooled 1 per cent. salt solution, which is done according to the following: The entire contents of a tube, 20 immunizing units, are placed in a mortar and crushed with the pestle; then 2 or 3 cc. salt solution is added, and the mixture rubbed until a uniform emulsion has been obtained. This emulsion is poured into a graduated cylinder holding 50 cc. The mixture in the cylinder is then made up to 30 cc. and poured into a wide-necked sterilized bottle holding 100 cc. The bottle then contains the inoculation substance ready for use, 2 cc. of which will be the dosage for the first inoculation of a calf. For the second inoculation the dose would therefore be contained in 10 cc. of the fluid, which is five times larger than the first dose. The ready emulsion should be used as soon as possible, at the latest within twenty-four hours after it has been made."

The injection of the virus is easily done. Clip the hair over the upper third of the left jugular vein, cleanse the parts with a 2 per cent. lysol solution, compress the vein with the thumb until a distinct enlargement appears, then insert the canula, and if the vein has been punctured, blood will flow freely from the canula; if no blood comes, partially withdraw the canula and reinsert in a direction slightly different from the first. Do not attempt to inject the virus until you are sure the vein has been properly punctured. This much done, unite the syringe with the canlua (which has been previously filled with the virus) and slowly inject its contents into the vein. Immediately after injection, the parts should again be cleansed with lysol solution. With this done, nothing further is necessary. The vaccination for tuberculosis, like that for anthrax, is done in two installments; the second injection follows three months later. The stability of the virus is such as to enable it to withstand much of adverse condition, without fear of deterioration.

The records of treatment by this method show that a large number of cattle have been inoculated in several states in Germany. This immunizing method has received the sanction of the agricultural law in Hessia, Oldenburg, Mecklenburg and the kingdom of Saxony. We will not attempt to present details of the result, but suffice it to state, that the result so far obtained has put the treatment within the sphere of what seems to be positive results.

This method is of immense value, and surpasses all others as to cheapness and easiness of application. It will supersede all previously proposed methods and render them absolutely superfluous."

"It is needless to mention that the successful suppression of cattle tuberculosis is of vast importance in the breeding of cattle. It would release agriculturists from a burden which has hitherto rested heavily upon them!" In the United States this loss amounts to millions of dollars yearly.

"We must also take into consideration and calculate the loss in the production of milk, arising from insufficient assimilation of food, and the lower percentage of nutrient substance contained in this milk, and last, but not least, the threatening danger of disease to humanity."—Reprinted from American Veterinary Review, by Claud D. Morris, V. S.

THE YOUNG BULL.

Editor Cultivator: Will you tell me through The Cultivator how to tame a young Jersey bull? He is 10 months old, is a splendid animal, but has developed a mean disposition. He hooks and stamps with his feet and last night knocked the hired man down.

Santa Barbara. B. E. P.

You ask a difficult question. Usually the Jersey bull is quite as tractable as any other until he reaches the age of three or four years, when he may develop traits of anger such as you say your bull has. The best thing to do with your bull is to let one man handle him. Break him to halter, if not already broken, ring his nose and have a cord strong enough to subdue him if the halter fails. Do not whip or beat him. That will only tend to make him still more vicious. Never fool with his head, speak kindly but firmly to him, tie his halter strap so he can not reach you with his head, and rub him with your hand, often, on the back and loins. Let him know you are his master. Keep that idea in his head all the time, for remember, a bull has a deal more sense than he is credited with possessing. Feed him, now and then, from the hand, salt, a split carrot, or an apple, and if he hooks at you, sharply push his head away. He will in time get over hooking, although the rule is always keep your eye on the best trained bull in the world.

Curry him every day with comb and brush, when he is tied, keep him away from the herd and feed him green feed with his rations. The rule is to handle a young bull gently. Don't show fear of him at any time, but always watch him. If at the end of a year you find you have made no progress in training him, and he shows growing meanness as he ages, you had better trim him and fatten him for the block.

Advertising Column for Members
OF THE

Profit in the Poultry Yard

BY MRS. A. BASLEY, HOLLYWOOD, CAL.

QUESTIONS AT INSTITUTE.

The letters I receive, and the many questions asked me at the Farmers' Institute, often give me a topic for our weekly chat. This week's chat was suggested by two of the questions at Elsinore. The first was, "Can a person feed hens by the rule of thumb?" My reply "It depends upon who owns the thumb" brought an audible smile. It was not intended to be a funny reply, although I always feel that a smiling audience is an appreciative one. But I wished to imply that feeding chickens by the "rule of thumb" which I suppose means without any plan or method is like cooking or making cake without measuring or without recipe.

We all know there are some women who are good cooks and say they never measure, they can guess at the right amount of the various ingredients, have good luck, and turn out a good cake. They are lucky! I am one that likes to measure the ingredients for my cake and take no risks, and so with chickens and hens, I like to go by rule, if I have a good rule or good recipe.

* * *

I am one of the lucky ones, however, for before I knew the why and the wherefore of feeding I was lucky enough to be feeding just about right, and so even by the "rule of thumb" my chicks flourished and grew, just grew without my understanding why. All the time, however, I was quietly experimenting and gaining experience. Just thirty years ago this month I was raising fine Houdans, I had them under hens and I fed differently, one brood had hard-boiled eggs chopped with onion tops and bread crumbs twice a day, the others wheat, rice, bread and milk, all were on a grass lawn. When they were three weeks old the chicks fed on hard boiled egg weighed a third more than the others, at least it took three of the others to balance the scales against two of the egg-fed youngsters. Do you wonder that I smile when I see articles in some of the poultry papers denouncing hard boiled eggs as exceedingly injurious to chicks? I was feeding the mothers of those chicks wheat and whole corn and by the time the chicks were two weeks old they began to eat the wheat also.

The hens were confined in coops on the back lawn, the chicks (70 in all) ran around them, when the weather was wet coops and all were moved into the wagon-shed. Every one of the seventy lived to maturity.

* * *

The second question propounded to me was, "What is the cheapest way of feeding fowls?" This was quite a tough nut to break! The cheapest way must be the best way, and the best way undoubtedly, judging by the results, must be the cheapest.

Food has its influence on health. In different localities some foods are cheaper than others, and to feed cheaply as well as successfully these foods must be mixed in proper ratio to give us the desired ration. The amount of food, the variety, and method of feeding, depends largely upon what your fowls have been accustomed to. Damaged food is money wasted, the best of food is none too good.

The needs of a fowl differ, but one thing I notice here in California is that the cheapest food we have is the very food that people forget to give their fowls.

The green food—Of the green foods alfalfa is the best; next to that lawn clippings of clover. Many a time have I driven ten or twelve miles to get clover lawn clippings from a friend's lawn. These would usually keep fresh on the north side of the barn for two days. Some of them I would dry on a cleanly swept yard in the sun, then sack them for future use. I freshened them by pouring either scalding or cold water over them and allowing them to stand a few hours. The fowls ate them with avidity. The lawn clippings cost me nothing and were one of my most valuable foods.

Alfalfa and clover contain more protein than any grasses; in fact, they have all the elements of the egg in them. Beets, carrots, turnips, pumpkins, cabbage, lettuce and any green vegetable that we would eat ourselves are good for fowls. Added to these I am now feeding what is called "Calfalfa." It is alfalfa dried and ground. At first the hens did not like it so I began with only one tablespoon of it for the whole flock (about two dozen fowls), the next day I gave only two tablespoonfuls, and gradually increased one spoonful at a time till now they eat it freely. In the same way, I commenced gradually with the ducks. It was inconvenient to feed the ducks any other green food during my absence from home, but they liked the "Calfalfa" and whilst they had it their eggs had a rich, deep-colored yolk. We know alfalfa colors cows' butter, and it has the same effect on the yolks of the eggs, making them a rich orange color.

Green food is the cheapest food, and is absolutely necessary if you wish the best results.

Now as to cheap other food, the most expensive part of the ration is the nitrogenous part, or the protein. Protein is found in most of our grains, but not in the proper proportion for making the

Prussian Lice Killer
Easy, quick and certain riddance of vermin on poultry and animals.
"I have used the Prussian Lice Killer on my chickens and it is certainly the best I ever used. It is easily applied and it does its work in great shape. I will say to my fellow poultry keepers that they will save time and trouble by using Prussian Lice Killer.
Harry Rutledge, Dyer, Ind.
½ Gallon 50c. 1 Gallon $1.00.
Prussian Lice Powder
The dust method. Sure death to lice, no injury to birds or animals.
"I used a 25c package of the Prussian Lice Powder on 16 head of lousy cattle, and the day after could not find a louse. I consider it the best thing I ever saw." H. V. Spafford, Kelso, N.D.
In 25c and 50c Packages.
Prussian Poultry Food
Guaranteed to produce healthy fowls, more rapid growth, make better layers and to ward off and cure Roup, Gapes, Cholera, etc.
"We have used Prussian Poultry Food for more than two years with great success. We find that it is the proper food for young chicks and just the thing to keep up laying hens."
Arnold Jungman, Poultry Yds, Gladstone, Minn.
In 25c and 50c Pkgs. 25 lb. Pail, $3.50.

Petaluma Incubators and Brooders
The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the **GOLD MEDAL** at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?
St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A Filcher, Commissioner.
And Now Comes New Reward for Merit:

eggs, animal food of some kind has to be added. How to add the animal food to the best advantage is the problem which each of us must solve for herself. I can merely make suggestions or tell what I do myself.

First of all, I give the hens all the skim milk that they will drink and whatever is left I make into cottage cheese (curd); the chicks, turkeys and hens eat this ravenously. This saves their meat bill. Secondly, I keep before them in a hopper, or tin pail the dried beef scraps and allow them to eat what they want—of course, if the other hopper of grain and calfalfa runs out, the hens will be forced to eat the meat scrap and that will affect their bowels, and if kept up too long might make them sick.

"The hoppers need filling," said I, on coming home.

"No, ma'am! they are brimful."

"Well, they were not full yesterday!"

"Who told you, mother?"

"The hens," said I.

"The dickens they did! But really, was it only a guess, or what made you think it?" I had noticed the droppings, but the boys still think the hens and I have a secret language.

In utilizing the cheap grains or foods, or the waste of the farm such as cheap or waste beans, pease, small potatoes and other vegetables by boiling these and mixing in bran a good supper can be made for fowls several times a week. Kitchen leavings and scraps scalded and mixed with bran are relished by fowls, and little savings like this will cheapen their keep.

EDITOR'S QUESTION BOX.

Little Chicks. (Subscriber, Norwalk.) I am always interested in what you write in the Cultivator and think you may be able to tell me what the trouble is with my little chicks. They hatch out strong and healthy. I use hens to hatch them and they do fine until they are about three weeks old; they begin to look sick, stand around and chirp. They get poor, their feathers all stand out; they don't seem to have any bowel trouble at first, but after a few days some of them have diarrhoea and they dwindle and die.

Answer. I would have replied personally, but have been absent at Farmers' Institutes. There is something wrong in your management of the chicks, but it is difficult for me to guess where the trouble is. I think it is in the feed. Try as much as possible to imitate nature in this; do not give them any mashes or cooked food, but get them on to hard grains, chick feed, green lettuce, and something to take nature's food of worms and bugs. I find hard boiled eggs excellent for this; about one egg for two dozen baby chicks; also onions chopped one with each egg. Clean water they must have and freedom from lice or vermin.

I think if you had kept your chicks dry and moderately warm, clean, and fed them chick feed three times a day with lettuce as a lunch in between and at supper time give them either chopped egg and onion mixed with bread crumbs (dry), or rolled oats, you would raise every one. I know I do. I also give mine clean water and skim milk.

* * *

Blood Meal. (J. B. G., Berros, Cal.) Please inform me through the Cultivator how to make blood meal out of fresh blood. I can get blood once a week for hens, and wish for a method of keeping it; also best way to feed it. Please give me name of ingredients

YOU CAN
FEED THIS MUCH
AT OUR RISK

THIS IS THE MONEY BACK LINE

Prove Purina Feeds
On Our
New Selling Plan
which our ample capital, immense mills, and the quality of our feeds make possible.

Purina Feeds are sold through dealers in 100-lb. bags. But to enable you to test them at our risk, we have gotten up a Special 40-lb. bag, with a "Money Back Line" one-quarter of the way down. We will send you four of these 40-lb. bags for $4.00 direct from the Acme Mills. Make your selection from this list.

PURINA CHICK FEED
PURINA SCRATCH FEED
PURINA MASH (to make hens lay)
ACALFA MEAL

Pick out your own assortment—not more than two bags of any one kind.

When the bags come, feed to the "Money Back Line" on each bag and watch *results*. One Full Quarter of each bag is yours to try at our risk, without a pledge or promise. If you are not thoroughly pleased in every way, just write us, and we will send back every penny of your money, freely and willingly, and tell you where to send the feed that's left at our expense. *We pay the freight both ways.*

Results are what tell the story—not theories—and if you don't get these *results* from Purina Feeds—you are not a cent out of pocket and the feed used has cost you nothing.

There's a feed or combination for every purpose and for all seasons. Every one has been Tested, Tried and Proved until we know that it is perfect for the purpose.

THE ACME MILLS COMPANY MADE THE TESTS

and have done it so thoroughly that every element of doubt, guesswork or uncertainty has been removed.

There are just three different elements prepared differently and in different combinations used in Purina Feeds. There are no medicines, condiments *or grit* in Purina Poultry Feeds.

FIRST—Clean, thoroughly ripened, perfectly sound grain and seeds without dust or smut,—fifteen or more kinds.

SECOND—Sweet, tender Alfalfa tops and leaves, perfectly green and well cured—no first cutting stemmy Alfalfa is used.

THIRD—Untainted lean meat, dried while fresh.

One kind of feed saves the lives of Little Chicks—brings up the largest percentage of every hatch to maturity in 60 to 90 days—healthy, vigorous and strong.

Other kinds and combinations.

Make *eggs*—make it possible to secure every egg your Hens are capable of producing.

Make sweet, tender, juicy flesh—delicate and toothsome as a milk-fed capon.

Make your *fowls fat* for marketing in the shortest possible time.

But—don't believe this until you have tried Purina Feeds at our risk—till you have proved their worth on your own Hens and Chicks and have the *results* right before your eyes.

This **Trial Offer** is good for 30 days from the date of this paper **Only.** Fill out this Order Blank and mail to-day.

of a good lice killer. I can keep my roosts clean but hens have body lice.

Answer. You can make pure blood meal by putting the blood when it coagulates into a bag and boiling it. Boil about ten minutes for each pint. Then dry it and it will crumble. Or you can simply boil the blood and strain out the thick part after the rest is white as water. I tried and prefer the first way.

Or you can use the blool by scalding it and mixing it thick with bran or cornmeal. I do not know the nutritive ratio of raw blood.

Lambert's Death to Lice is an excellent powder for killing lice. You can also make a good lice powder by taking a peck of air slacked lime, add to it an ounce of 90 per cent. carbolic acid, stir thoroughly, add a peck of tobacco dust, mix well. Recipe 2. Sifted coal ashes, half a peck; Lee's Lice Killer, half a cup and half peck tobacco dust. Mix thoroughly. Dig up a space in the yard for the hens to bathe in, empty ashes out of cook stove in a heap and they will keep clean.

* * *

Eversion of oviduct. (Novice, Santa Monica.) Kindly inform subscriber to your valuable paper the probable trouble with Barred Plymouth Rock pullet found dead on nest. On examining vent found liver colored substance, as though partly turned inside out.

Your pullet died of prolapsus or eversion of the oviduct. It usually comes from eggs being too large, or from too stimulating food or condiments, constipation or any condition which prevents the passage of the egg.

* * *

Editor Culivator—What is earliest age to feed Leghorn chicks a little whole wheat in way of weaning from ground mixed feed?

Answer. You can begin feeding whole wheat by mixing it with the finer feed as soon as the chicks will pick it up and swallow it; the sooner the better. Remember that chicks do best when they can have a variety of grains and green food, as well as animal food. When chicks are raised with a mother I always feed her wheat from the first and when they are two weeks old I see them eating a little.

FUTURE OF POULTRY RAISING IN CALIFORNIA.

Anna L. Pinkerton, inventor of the Queen Incubator at Lincoln, Neb., is now in California and doing good work for the state in calling attention of Easterners in letters to papers there to California advantages as a poultry producing section. In a letter to the Poultry Keeper she says:

Poultry raising is still in its infancy in the far West, in fact, it has hardly passed the experimental stage, but the possbilities are so great, and the certainty of success so absolute, that far-sighted men are investing their money in the industry on a scale that will make California, within the next five years, one of the greatest, if not the greatest poultry state in America.

Let us for a moment consider the reasons why California should be the great American raising ground, the source of the country's poultry supply.

The climate is so equable that there is no season of the year during which the fowls may not be allowed to run at large. This, in itself, is of the greatest advantage in the rearing of young chicks. In the Eastern climates it is almost impossible to successfully

HYNES, CALIFORNIA

Breeders of S. C. White Leghorns Exclusively

Fine Feathers alone do not make the profitable hen. Our fowls have the reputation of being ***extra large, handsome*** and ***extra heavy layers.*** Last season, our eggs averaged over 95 per cent. fertile. ***Remember***—In getting eggs from us, you do not get them from the general runs. We have but one grade of eggs to sell for hatching and those are from our breeding pen composed of only the choicest fowls, selected from hundreds that are ***bred to lay.*** Hens that approach the ***200 egg record.***

Price of Eggs—$1.50 per 15, $5 per 100. ***Send for Illustrated Catalogue. Address,***

LEO. W. MARDEN, Manager

raise broods of chicks during the winter months, as fowls raised in artificially heated houses, even did they survive the rigors of the winter, would be weaklings. In California it is possible to keep your incubators going the whole year round and chicks hatched in December are as healthy and will grow as rapidly as those hatched in any other month.

But it is not only its mild winters which marks California as the logical supply source of poultry products. Summer in California is a second edition of winter with the rain left out, the humid atmosphere of the East is unknown.

There is a market for every chicken and egg produced in the state, and it is only fair to presume that as the state grows, as it is bound to, the demand will increase in proportion.

In addition to the income derived from the poultry on a ranch, there is always an additional revenue to be made from the fruit trees which can be planted to advantage over the entire stretch of land.

BUTTERMILK FOR CHICKENS.

F. A. Leighton, local manager of the Beatrice (Ia.) Creamery Company, has taken up with the superintendent of the company the project of establishing a large poultry farm in the vicinity of Des Moines. The principal reason for taking up this business would be to utilize to advantage the great amount of buttermilk which the company has not been able to handle profitably. It has been found that buttermilk fed chickens bring fancy prices because of the quality of their meat and the plumpness which comes to the fowls after having been fed on buttermilk. The company has contracts now with Swift & Co., who are using it to fatten chickens bought over the state before killing and dressing them. Swift's principal Iowa feeding point is Ottumwa. The Beatrice company also ships buttermilk elsewhere and sells quantities of it about town, and yet is not able to dispose of it to any advantage.

FRESH AIR AND WARMTH.

Fresh air is demanded by all classes of live stock (including poultry), but in winter the farmer should endeavor to give an abundance of fresh air without crowding his flocks. Cold draughts chill the fowls, while crowding them is going to the other extreme. The great fault of houses generally is that they are not sufficiently ventilated, or are too much so, the consequences being that fatal diseases are generated, causing destruction of the flock before the diseases can be stopped. If it is desired to increase the warmth of the house sliding windows, four or five feet high, as wide as desired, may be set to the south side of the house. Put wire netting against these, so that the hens cannot fly or jump against the glass and break it. These can be removed during warm weather, and a whole side of the poultry house may be left open. In this case it would be so well ventilated that the front side need not be over seven feet, and the roof not carried up high. For the perches, strips of scantling two by three inches are also excellent. Set all roosts at the same height, and so distant from each other that the hens on each perch cannot reach those on the other.—Farm and Fireside.

Mate your best stock a few days before selecting eggs for setting and you will be more sure of getting fertile eggs, and of the desired mating.

Eggs for hatching should be fresh—fresher the better.

FREE BOOK

"Raising Chickens"

The Coulson Poultry and Stock Food Co. at Petaluma, Cal., has got out a very fine Book about "RAISING CHICKENS."

This book shows photographs of many of the largest and successful poultry farms and ranches of the Pacific Coast.

Some of these are reproduced in colors by what is called Lukagraph process, showing the beautiful white chickens, with red combs; and the basketful of fresh laid eggs, the green grass on the hills, etc. These pictures have a very pretty and pleasing effect, and make the book very interesting to read. It gives stories of Poultry Success—tells how farmers have a Gold Mine in poultry and hogs.

It tells how the different ones raise the little chicks—how to feed them and care for them, and also tells how to get $4.00 worth of eggs from one hen in a year.

Every farmer's wife should send and get one of these books. Every poultry raiser who gets one of these books will think he has struck it rich.

The book contains more than **50,000 words** and occupies **10,000 square inches of paper.** illustrated with **200 pictures** which represent about **2590 square inches of engravings.**

The book cost the Coulson Co. several thousand dollars, and is written for the benefit of the poultry industry of California.

If you intend to have any young chicks to raise, or are in any way interested in poultry, it will be to your interest to get one of these books—**NOW**—while you have the chance, and before you forget about it.

Remember, the book is free, providing you send 10 cents to pay postage.

104 large pages—California Poultry Farms—illustrated in beautiful colored engravings.

The Farmer's Gold Mine, page 60.

Coulson Co. Experimental Poultry Farm, Page 1.

How to make $1000.00 Fattening Hogs, Page 61.

Feeding 20,000 Chickens, Page 85.

$1100.00 worth of Eggs from 100 Laying Hens, Page 39.

A Million Dollars for the Benefit of the Poultry Raisers, Page 94.

One Acre of Hens paid more than 100 acres in grain, Page 39.

View of Colony Houses on large Poultry Farms, Page 87,

He sat down most of his time, Page 56.

Steamers loaded with feed for chickens going up the river, Page 50-52.

Story of the Greatest Chicken Village in the World, Page 10.

How to care for Young Chicks in the brooder, how to feed the young chicks, how to feed the hens to make the most money, etc.

It cost us about $2000.00 to put out this large book; it took about three tons of the best paper and hundreds of engravings. Three large printing establishments worked on it for months, kept the presses going day and night.

It took an engraving establishment two months to make half-tone engravings and yet—after all this labor—we are going to give one book, **TO YOU—FREE.** The paper in it weighs nearly a pound—send 10c for postage, your name, and P. O. Address, and let us know how many chickens you keep and what other stock.

Address Advertising Department.

Coulson
Poultry
and Stock
Food Co.
Petaluma, California

Photograph Taken on McDonald's Ranch. 10 Weeks Old Chicks Raised on Coulson's Chick Feed.

If Mr. McDonald can raise chickens like these by feeding them Coulson's special Chick Food, why not you? Suppose you give Coulson's Chick Food a trial. It will not cost you but a trifle more than other feed and the way it makes chicks grow is marvelous.

A Month Ahead of Your Neighbor

By feeding your little chicks Coulson's Special Dry Chick Food, they will do so well and grow so fast, and be so lively and healthy(that they will reach the average weight of 2 1-2 pounds apiece, a month sooner than your neighbors', who feed some other kind of feed.

$1.00 a Dozen More

By feeding your chicks on Coulson's Special Dry Chick Food they will be so large and plump, that, besides sending them to market sooner, you will get from 50c to 75c and possibly $1.00 a dozen more for the broilers or fryers, than your neighbor, who has chicks of the same age and who feeds some other kind of feed.

Results Will Surprise You

As Mr. Ward, proprietor of the Glendale Poultry Farm wrote; "Fed a flock of chickens on Coulson's Special Dry Chick Feed up to 3 monthsof age, and the results were a SURPRISE TO ME. The birds were large, and the cockerels I sold to a market in San Francisco, and GOT A BIG PRICE with a REQUEST TO SEND MORE to them at any time I had more cockerels of the same QUALITY.

Ask Your Dealer For It

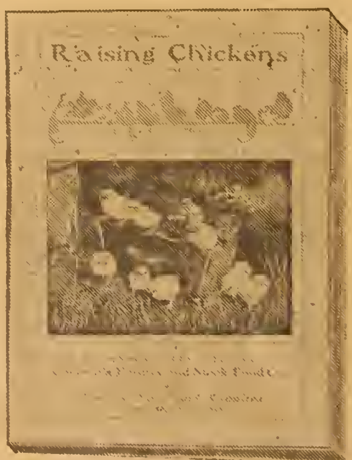
You should be able to get COULSON'S SPECIAL DRY CHICK FEED at most any feed store. In case you can't find it at the stores, "DON'T ACCEPT A SUBSTITUTE." He may tell you: "I have several kinds of chick feed that are just as good as, good and cheaper." Those kinds do for people who don't know their own best interests—but not for YOU.

You are going to get COULSON'S SPECIAL—you are going to put your chicks on the market a month sooner—you are going to get more for them—you are going to raise nicef and larger chicks, and you know that COULSON'S SPECIAL DRY CHICK FEED is what you want, and what you are going to have, because you know it GOES TWICE AS FAR as any other feed, and such splendid results.

We Ship It—If the Stores Don't Have It

If you can't get it at some store in your town. send to us $3.00 and we will send you a 100-lb. sack by next freight. For $4.00 we will send it freight paid; for $7.50, 200-lbs., freight paid; for $17.50, 500 pounds, freight paid Ask your dealer first. If he hasn't it then send to us. We remain at your service,

COULSON POULTRY & STOCK FOOD CO.



CUT THIS OUT:

I now keep: No. of hens............No. of young chicks...............

No. of turkeys...........

My name is...

P. O. Address........................ ....

Queries and Replies

MARKET REPORTS.

Editor Cultivator: In Cultivator of March 23, you quote light amber honey at 6 cts. Will you kindly inform me on what authority you make this statement? Is it possible there can be such a difference in Los Angeles and Redlands prices? Here we are offeredo 3¾c.—J. H. A., Craftonville.

While you are paid but 3¾ cents for your honey, it is wholesaled at 6 cents to the grocer, who in turn retails it at 10 cents. For our market reports we go to the firms who buy your honey. We have no recourse but to print the prices which they give us. These are jobbers prices or the price at which honey is wholesaled. You will find the same scale of prices quoted in all the daily papers as well. The same is true of all commodities and all market reports. We have no way of finding out what the producers can obtain except we have honey to sell.

EGYPTIAN CLOVER.

Editor Cultivator:—Has the Egyptian Clover (berseem) been experimented with in Southern California, and if so, with what results? Is it more tolerant of alkali than alfalfa?—E. V., Santa Ana.

So far Berseem cannot compare with alfalfa as an alkali or salt resistant plant. Alfalfa is a deep rooting plant and Berseem is not. It has been tried in several places on the Colorado desert and alfalfa has discounted it more than ten to one, both under like conditions.

CULTIVATING STRAWBERRIES.

Editor Cultivator:—Will you please tell me how to cultivate strawberries? Should they be hoed around or just let stand and keep the weeds out? Also how often should they be irrigated?—Subscriber.

If you are growing strawberries on a large scale, it is necesary to do some cultivation, but the ground should not be cultivated deep as the roots are shallow feeders and they must not be disturbed. If you have but a few garden rows, we would mulch with straw. If you have a larger area, straw is better than cultivation provided the straw is available. The period of irrigation will have to be governed by the character of the soil. Nobody can determine that as well as yourself.

MILDEW ON ROSES.

Editor Cultivator:—Can you tell me what to do to stop the mildew on rose bushes? I have two climbing rose bushes which were affected so badly last summer that the leaves dropped off. I thought they would die, but this winter they seemed to recover, put forth a heavy growth, and are full of blossoms, but I notice that the blight or mildew, as they call it, is beginning to appear again. The leaves wilt, turn yellow, and then drop off. They have a strong, musty odor. Any information you can give me either through the columns of the Cultivator or by mail will be greatly appreciated—W. M. C., Lindsay.

Spray the bushes with Bordeaux after the blooming period in the fall and when the young growth starts dust the plants in the morning while the dew is on them with finely ground sulphur. Sprinkle some on the ground beneath the bushes also. Repeat this operation three or four times during the spring and summer and the mildew will be killed.

GUM ON PEACH TREES.

Editor Cultivator:—What is the matter with our peach trees? I send two samples. The trees look as though fire had been built under them, being the worst afflicted at the bottom. The blight or whatever it is seems general throughout this section, and will surely make a short crop of peaches in this vicinity. Please give opinion, information, and remedy if possible.—E. A., Selma.

The sample shows that the trees are afflicted with some sort of gum disease, but what the cause is can perhaps only be determined by careful investigation by some person who understands plant diseases. Very often a malady will prevail that is caused by climatic conditions, and it is our opinion that this trouble will disappear after a while provided the trees come out in good shape during the summer. If it is a disease that is caused by germs getting a foothold from without, lime, salt and sulphur will help it out, but if it is a disease of the sap, which it appears to be, such sprays will not help it. It is our opinion that it will pass away in time. We have noticed the same trouble in other deciduous trees which have recovered. We would try splitting the bark on a few trees to see what effect it had. See also "Fungus disease in the peach section," on the "California Horticulturally" page.

FUMIGATING.

Edtor Cultivator:—Will you kindly tell me through your paper how to use cyanid of potash for fumigating a house?—Subscriber, Pomona.

Stop up all the cracks around the doors and windows, leave all the inside doors open, and fix the windows so they may be opened from the outside. Also keep all the door keys so that the doors may be opened from the outside. Figure the contents in cubic feet of all the inside space in the house. For every 100 cubic feet use two ounces of cyanide. For every ounce of cyanide use one ounce of sulphuric acid and two ounces of water. This dose is twice as strong as is usually applied to orange trees. It will injure no goods which might be in the building. Open the house and allow it to ventilate an hour before entering.

We suggest that you use formaldehyde. It is much more effective in destroying germs and not so dangerous. A pint of this evaporated over a stove will disinfect a large house Keep the house closed at least two hours with either of these materials.

RESERVOIR QUERY.

How large a reservoir will it require to hold a miner's inch of water with 50-inch head for 12 hours, and how heavy should the wall be? How many barrels of cement will it require and how to guage the amount of water in the reservoir?—J. A. D., Charter Oak.

The above query is not very definite, but we suppose it is intended to build a reservoir to contain the water which will run through an opening 1 inch square under 50 inches pressure in 12 hours. A miner's inch of water, as is usually run in California, is that amount which will run through an inch square opening under a 4-inch pressure, and is 6480 gallons in 12 hours. The amount which will pass through the same opening under 50 inches pressure will be about three times as much, or 19,500 gallons. This will require a reservoir 25 feet by 25 feet 4 feet deep.

The wall of such a reservoir will be safe if made 4 inches thick of clean gravel with good cement in the ratio of six parts of gravel to one part of cement, well mixed and well tamped. The wall should have a support of earth reaching to the top on the outside, which has been well puddled as it is put in place.

The materials required will be six cubic yards of gravel, which must be clean, and seven barrels of cement.

Gauging, or measuring, the reservoir when partly filled can be readily done by remembering that it will take 400 gallons of water to fill the reservoir one inch in depth.

In the above it is supposed that the bottom will be of earth, without cement.

The new Cudahy Packing Company's storage and distributing warehouse at San Bernardino is to be built of moulded cement building blocks.

HE DIDN'T SELL.

Farmer Thompson got discouraged,
And thought he'd sell the farm,
To be sure, he was doing well—
Had no reason for alarm.
His finances were excellent,
As his bank account well told;
He simply got to feeling blue,
And the farm was to be sold.

So he gave it to an agent
In a little town nearby,
With only these instructions—
Just sell it on the fly.
In his little local paper
The description came to hand.
He looked it up and found it
In a column headed "Land."

"Finest farm in Banner township;
The gem of all my list.
If you're looking for a bargain,
This farm should not be missed.
This year the corn made sixty,
And thirty-five the wheat;
From the view-point of production
This one can not be beat.
The best for miles around;
And every convenience
Upon the farm is found."

Amazement sat upon him
As he perused the list,
And long before he finished
He was reading thro' a mist.
He hurried to the telephone,
Called the agent with a yell,
Saying, "Take my farm right off your list,
I've concluded not to sell."

—*D. M. Hatch.*

THE LITTLE GIRL AT THE WINDOW.

Hazel had thought a good deal about the little girl at the window. She had such a sober little face and such wishful blue eyes, and she was always waiting at that same second-story window in the big tenement that stretched clear up to Hazel's back yard. At least she was there every time Hazel looked, and that had been a good many times those last few days, for some way she could not keep that pale, listless little face out of her mind.

The Camerons had only moved into that part of the city the week before. Until that time they had lived in a flat, so it seemed quite wonderful to Hazel to have a whole house to themselves, and better yet to have a yard—yes, two yards, for there was a front yard and a back yard with the house. She had always wanted a flower-garden, but there had never been a foot of ground with the flats. Now, however, her dream of pansy faces, of bright tulips, of great fragrant bunches of sweet peas was about to be realized. Her mother had told her that she might have two beds in the front yard and plant what she pleased. She could hardly wait for her father to dig the ground, and at first spent nearly all her spare time planning just what flowers she would have and just where she would plant each one. She was a genuine little flower-lover, and never tired of studying the seed catalogues.

But the last few days her interest had wavered between her flowers and the little girl in the window. Every time Hazel went into the back yard she saw her there, sitting in just the same place, looking listlessly out of the window. She wondered why, and why she looked so sober, and why there never seemed to be any one else in the room, and a great many more "whys?"

One morning, earlier than usual, she looked up at the window, and the little girl was not there. "It must be she isn't up yet," she thought. But just then a woman came to the window with the little girl in her arms and put her down very carefully in the chair. It flashed through Hazel's mind why the little girl always stayed in one place and why she was so pale; it must be she was sick. Hazel's eyes grew tender with sympathy, for she had been shut up in the house with the measles the summer before, and she knew just how hard it seemed; that is she thought she knew, but she changed her mind about that a few minutes later.

In a little while the woman came to the window with her hat on, carrying a plate and a cup. She set these on a stand near the chair, kissed the little girl and went away. Hazel knew that she had probably gone to her work, and would not be back before night. Her brown eyes were full of sympathy. Poor little girl! It must be hard not only to be sick, but to have to stay alone all day without even a doll or a kitten to keep her company. She remembered how lonesome she used to get, even with her mother there and two kittens, four dolls, a big pile of story-books and lots of other things.

Just then her mother called her to breakfast. But all day she kept thinking of the little girl and wishing she could do something to make her happy. Several times she looked up art the window. Yes, she was still there, and her face looked paler and more sober than ever.

Hazel wished she dared go up to visit her and carry books and games so she would have something with which to amuse herself during the long days; but Hazel was a shy little girl and could not make up her mind to go. She thought and thought and planned a great many things to do for the little girl; but some way she did not dare carry out any of the plans. If the window had been on the ground floor she felt certain she could have made friends, but she had not courage to go to the big tenement and inquire the way up to her room.

A few mornings afterward when he kissed her good-by her father said, "Well Chicken, I'll try to get home early enough to spade up the ground for your garden this afternoon."

"O goody!" Hazel danced up and down and clapped her hands. She got out her packages of seeds and planned the garden all out once more just the way she wanted it.

Then she remembered the little girl in the window and wished she could come down and help. Some way it seemed almost selfish to have such a good time when the little girl up there was so lonesome.

By and by she thought of something. Her eyes grew bright and she clapped her hands softly. This time she was sure she had thought of a plan.

Half an hour later her mother was surprised to have Hazel ask if she might have her garden in the back yard.

"Why, child," her mother said, "what in the world do you want your garden way back there for? It's much prettier here in the front yard."

Then the story about the little girl came out. "And I thought if I made my garden in the back yard, she could watch things grow and see the flowers and may be it would seem a little bit like having a garden of her own," Hazel concluded, her eyes as bright at stars.

Her mother readily consented when she knew why Hazel had changed her mind; so the little girl spent the rest of the day replanning her garden.

She kept looking up at the child at the window while her father was spading up the ground that afternoon. She smiled happily to herself when she saw the pale little face pressed close to the window. And when the little girl smiled back Hazel felt as if they were beginning to get acquainted. "Just think, papa," she said, "that's the very first time I ever saw her smile; I don't believe she ever did smile before."

The next morning Hazel was out bright and early sowing her seeds. But she was not too early for the little girl in the window. "She looks happier already; doesn't she, mamma?" Hazel asked eagerly. "And I know when the plants begin to grow she'll like to watch them. Just think, there hasn't been a thing that was pretty for her to look at."

Her mother smiled and stroked back the brown curls tenderly. She thought her little girl's sunshiny face would make almost any one happier.

The days went by and Hazel spent a large share of her time working in the garden, and the little girl in the window watched. They always smiled at each other now; but that was all. Hazel's cheeks were growing rosy and brown with the exercise and the fresh air; and the pale little face in the window was losing its listlessness and growing almost happy.

The plants grew finely, and at last one morning there was a blossom. The little girl in the window saw it first. The window was up now and when Hazel came into the yard she was leaning out, breathlessly watching to see what Hazel would do.

What Hazel did was to clap her hands and dance all about the garden. Then

ANTS You can keep them down and out with **KELLOG'S ANT PASTE** which is now considered the best exterminator in the known world. One bottle does the work, only 25 cts. If your dealer does not keep it send 40 cents to the Manufactory 1010 E 9th St. Los Angeles and you will receive it prepaid by return express. Dealers wanted.

she dropped down on her knees and buried her small nose in the heart of the flower. She looked up to see if the other little girl had seen it, too. "O, aren't you glad!" she cried. That was the first time the child ever had spoken.

After that blossoms came thick and fast. Hazel picked a big bunch a few days later. She looked up at the window thoughtfully; then her face brightened. "You tell your mamma to give you a long string," she called; "then tomorrow you can let it down and I'll tie the flowers to it, and you can pull them up."

So every little while a big bunch of flowers went up to the window and was put into a glass of water on the stand. The little girl looked and looked at them, and buried her pale face lovingly in their fragrant depths and talked to them, telling them everything that was in her heart, just as if they understood. She was not lonesome any more.

One evening in the early fall Hazel went out into the back yard and looked up at the window as usual. Then her eyes grew round with surprise, for the little face up there seemed fairly shining with happiness. "What do you suppose?" a glad little voice called down; then ran on, too eager to wait for a reply. "The doctor says I'm going to get well!"

Hazel clapped her hands. "O, I'm so glad!" she cried.

"And what do you suppose he says cured me?" the eager little voice went on.

Hazel shook her head; she could not guess.

"He says the flowers cured me!" She pressed her cheek lovingly against the big bunch of blossoms beside her.

Just then her mother came to the window and put a work-hardened hand on the fair hair, her face shining with a great happiness. "Indeed they did cure her, Miss," she said, smiling down at Hazel. 'The doctor said she was all run down and never would have got well sitting here alone all day with nothing to interest her. He said she would have died before this if it hadn't been for those flowers. But she has got stronger every day since she got interested in them; they seemed to be such company. And now the doctor says she is really going to get well." There were tears no the mother's thin cheeks, but they were happy tears.

"O, I'm so glad, so glad!" Hazel's own eyes were shining almost as brightly as the two pair of eyes in the window above. She flew into the house to tell her mother all about it. "O, mamma, you don't know how glad I am I had my flowers in the back yard this summer. Isn't it just lovely!" she concluded, breathlessly.—Marion Brier, in Congregationalist.

LIFE TOO SHORT.

"Life is too short for any bitter feeling;
Time is the best avenger, if we wait;
The years speed by and on their wings bear healing;
We have no room for anything like hate;
This solid truth the low mounds seem revealing—
That thick and fast about our feet are stealing,
Life seems too short."

"Is your father at home?" inquired the visitor of a little girl. "What is your name?" asked the child. "Just tell him that it is his old friend, Bill." "Then he is not at home, for I heard him tell mother if any bills came to say that he was not at home," responded the child.

A girl in West Virginia recently walked five miles in the rain to get married. She will probably not have to walk over a quarter of a mile in the rain and snow to get an armful of wood, in the near future.

A. PILLAR OF STRENGTH.

In writing as I do for numerous home and household departments, I study and strive to be helpful to my sister housewives. Do you realize, my dear mothers of families, and so much resting upon your shoulders—what a blessing daily good eyesight is? Very few people care for their eyes properly, and it is only when failing sight warns us of the danger, that we seem to realize the injury we are doing them. When for any reason the eyes become weak and inflamed, the lids red and swollen, dissolve a teaspoonful of boracic acid in a cupful of warm water, and bathe them in it every two hours during the day.

Noted oculists use this remedy and say it is perfectly safe and harmless. I have found such quick relief from this simple wash that I felt I might do good with it, especially with young mothers who live in the country and have to rely upon themselves oftentimes. Let such mothers and housewives fortify themselves with such safe remedies as boracic acid, for children often have weak, inflamed eyes from a cold. Then it is fine to gargle the throat with when sore or inflamed. It gives quick relief to gargle it and snuff up the nostrils for catarrh-colds.

SARA H. HENTON.

Boracic acid to be effective, should be chemically pure, and the amount used should not exceed 10 or 15 drops to the ounce of distilled water. If the housewife is going to be her own physician she ought to provide herself with a graduate glass for measuring, a distiller to get pure water, and have a fund of common sense behind her to avoid mistakes.—Ed.

ABOUT SWIMMING.

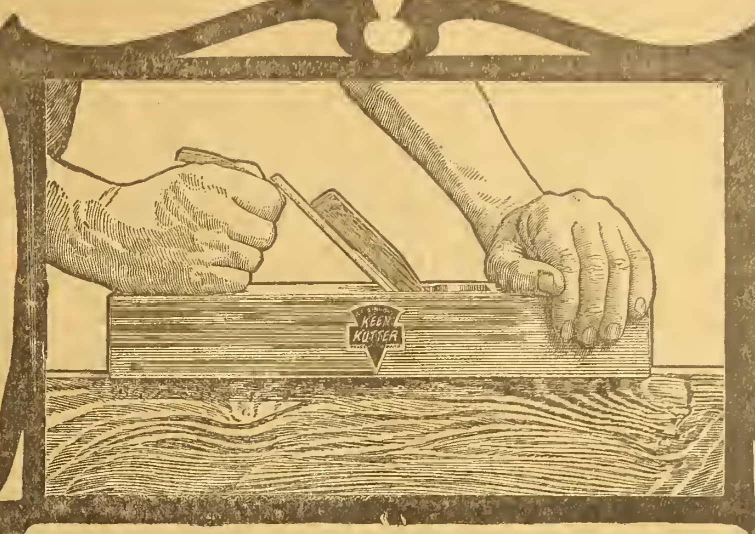
The sinking of the Valencia on the ocean, about a month ago, has turned the attention of the public to the art of swimming. Scores of persons doubtless might have been saved had they understood how to use life-preservers. Dozens of people died no doubt from fright, who might have been saved had they not known they could not swim and therefore were powerless to help themselves by taking advantage of circumstances.

Strange that man of all the animals is most helpless in the water, and stranger that as an adult he exhibits less capacity for self-preservation in it than does the infant. Falling into the water and strangling slightly, the frightened adult throws his arms into the air and sinks out of sight. Plunge a year-old babe in the water and he will right himself and strike out dog fashion with both hands, swimming.

Immersed in water, the body of the average man weighs one pound. If he keeps his mouth closed and his breath shut off he will float, head up, to the line of his eyes. Just how little effort there should be to keep his nose out of water is apparent. In thousands of emergencies a person needs only to keep afloat for a few minutes in order to be rescued.

But fright and shock and chill rob man of this power unless he be trained to the buoyancy of water. In the opening of the bathing season just at hand, no vacation resolve should be more closely adhered to and carried out than the resolve of a person to learn to swim.

It may mean life to himself because of the knowledge; it may be life to others. In any degree of efficiency at swimming there is pleasure and recreation, while in an emergency it is more than an art.



In Actual Use

Keen Kutter Quality tells in the actual use of the tool. Keen Kutter Tools are not retired by an occasional knot or tough piece of material. They are made to stand hard work and lots of it. They are as good as new after poor tools have gone to the scrap heap. The

KEEN KUTTER

brand covers a complete line of tools. In buying any kind of tool just see that the name Keen Kutter is on it and you have assurance of full satisfaction. Keen Kutter Tools have been Standard of America for 36 years and are the best that brains, money and skill can produce.

Some of the kinds of Keen Kutter Tools are: Axes, Hammers, Hatchets, Chisels, Screw Drivers, Auger Bits, Files, Planes, Draw Knives, Saws, Scythes, Tinners' Snips, Scissors, Shears, Razors, etc., and Knives of all kinds. If your dealer does not keep Keen Kutter Tools, write us and learn where to get them. Every Keen Kutter Tool is sold under this Mark and Motto:

"The Recollection of Quality Remains Long After the Price is Forgotten."

Climate and Crops

SACRAMENTO VALLEY.

The week began with generaly clear pleasant weather, except that strong north winds prevailed. The north wind continued until Thursday. On Friday abnormally warm weather occurred. In the northern portion of the valley maximum temperatures above 80° were reported. At Red Bluff the maximum temperature was 83° on the 5th and at Sacramento 74°. There was no rain. The river fell from a stage of 28.6 feet at Colusa at the beginning of the week, almost the highest water on record, to a stage of 22 feet at the close of the week. Considering the large volume of water in motion very little damage resulted. At Sacramento the river reached a height of 27.4 feet at the beginning of the week, and at the close of the week was below 25 feet. The snowfall in the Sierra was light during the week, but a large quantity of snow remains on the ground and is disappearing very slowly. At Summit at the close of the week 194 inches were reported on the ground, while last year at the same date the amount was 38 inches.

* * *

COAST AND BAY SECTIONS.

Seasonable weather without rain prevailed during the week, except on Thursday, when abnormally warm weather occurred. At San Francisco a maximum temperature of 76° occurred and equally high temperatures occurred at other points. Strong northwest winds were blowing at the close of the preceding week and diminished slowly on Monday and Tuesday. A southeast wind of 34 miles per hour occurred on Tuesday at Eureka and a north wind of 36 miles per hour on Wednesday morning at the same place. At the close of the week the mornings were cloudy, but afternoons and nights clear.

* * *

SAN JOAQUIN VALLEY.

The weather was somewhat unsettled, but with much more sunshine than the previous week. The rains of the preceding week saturated the ground thoroughly and there is probably more water available and in sight than for many years past. The following report is given by the correspondent at Tulare:

"March has been a rain record-breaker in Tulare. On the afternoon of the 30th, the storm of rain, hail and thunder broke the record for this county. Clouds from the southwest, with heavy thunder, but no lightning, were seen coming for more than an hour before the storm broke. When it came the oldest inhabitant had never seen its equal here. Rain was followed by three days of cold northwest wind."

* * *

SOUTHERN CALIFORNIA.

The week was showery, with some unusually heavy thunderstorms on the 4th and 5th. Other portions of the week were clear, with moderate temperatures. An unusual feature was a thunderstorm at San Diego on the 4th which the observer says was the 6th thunderstorm in any April for 35 years. The prevailing winds were from the southwest. The correspondent at Poway reports a temperature of 37° on the morning of April 2nd. At Los Angeles a minimum temperature of 40° was reported. There was considerable interruption of rail travel during the week as well as during the preceding week. Heavy rains caused a number of washouts. The country roads are reported to be in bad condition from the late heavy rains. The week closed with clear, cold weather and drying northerly winds.

CITRUS MARKETS

So far ts the orange market in New York and other Eastern points is concerned, substantially everything is left to California now. There is a market for Floridas when they are desirable, but this late in the season there is quite likely to be more or less decay or shriveling, even though the fruit has been kept in cold storage all winter. The cold storage fruit is not as desirable for dealers, since it will not keep as well as that fresh from the trees, like the California shipments. At present, the market is entirely devoted to Californias, and sales become more and more active. Prices may fluctuate, but as a whole, demand and prices are both steady.

NEW YORK, April 10.—Twenty-five cars were sold at auction today. The market is lower. The weather is favorable.

Gasoline Engines For Irrigating.

THE I. H. C. Gasoline Engines are especially adapted for irrigating purposes.

They will be found safe, durable, simple, and economical.

With maximum power, they can be operated at a minimum expense.

Expert knowledge or previous experience not required to operate them.

They can be attached to any kind of pump in any position, for raising water from deep or shallow wells, reservoirs, canals or running streams.

They excel in **full, regular and long sustained power.**

They can also be used for a general purpose engine for sawing wood, churning, cream separating, feed grinding, etc.

They are unequaled for power of all kinds.

Made in variety of sizes and styles:

Vertical—2, 3, 5 Horse Power.

Horizontal—(Portable and Stationary), **4, 6, 8, 10, 12 or 15 Horse Power.**

An engine of this description, with a suitable pump, makes agriculture a success where it would otherwise be impossible.

Call on local agent and examine these engines or write nearest general agency for illustrated catalog.

WESTERN GENERAL AGENCIES: Denver, Col., Helena, Mont., Portland, Ore., Spokane, Wash., Salt Lake City, Utah, San Francisco, Cal.

INTERNATIONAL HARVESTER COMPANY OF AMERICA, CHICAGO, ILL.
(INCORPORATED.)

The Sure-Go Gasoline Engine

High in efficiency and low in price. This engine will give you entire satisfaction if given a trial Fully guaranteed to develop the actual horse power at which they are rated. Have all the improvements and perfectly built over approved patterns with all parts interchangeable. Turn to your last Cultivator and be convinced. Simple, reliable, durable, economical, and powerful engine.

The Pomona Pump

The New Pomona Pump is now being manufactured with machine cut gears and machine cut steel or bronze pinions. The pump fitted with this kind of gearing runs as smooth as a clock and there is absolutely no noise or vibration. The company have recently taken contracts for installing their largest sized pump with this class of gearing for the Artesian Belt Water Company of San Dimas, Western Water & Power Company of Glendora and other large irrigation companies. They are required to furnish these pumps with cylinders up to 12 inches in diameter and 72 stroke which has capacity of over 60 Miner's inches of water. The valves are made entirely of phosphor bronze with ground metal taper seats so there is very little obstructiin to the water in passing through them and it is impossible to clog them with sand. These, in connection with machine cut gears, in the pump head, make a strictly high grade pumping outfit and the best by a long ways of anything on the market today.

This head and valves are both protected by United States patent. Beware of infringing as both manfacturer and user are liable.

The company has recently installed one of their latest improved heads for the Santa Anita Land Company, a subdivison of the Baldwin Ranch. Below is what the owners have to say about it:

"The new 38 pump you installed for us on our tract on the E. J. (Lucky) Baldwin Ranch is giving us satisfaction in every way. We think we have the very best that money will buy. Both as regards to pump, material used and installation. We made an excellent change when we removed the pump we had been using and installed your make"

We have pleased these people and there is no reason why we cannot please you.

COREOPSIS—CALIFORNIA SUNBEAMS.

This is another of the garden's great forces in yellow, strengthened with rich red-maroons and browns. Sow in the open ground in spring, and in thinning or transplanting give the plants plenty of room to spread. Their tall, slender habit makes neat staking and tying necessary. Are fine for cutting, flowers very large, in a variety of beautiful forms and various shades of yellow and brown.

WHITE MAMAN COCHET.

A most charming new and lovely rose of American origin; a sport from that grand rose, Maman Cochet; style of growth and flower identical with its parent; full, firm, long, large buds; the photograph shows a full blown flower, this variety is already being planted for cut flowers and as a garden sort it is going to to take front rank. Like its parent, both buds and flowers are of enormous size, produced on splendid stems and of the best quality for cutting.

Courtesy F. Gilman Taylor Seed Co.

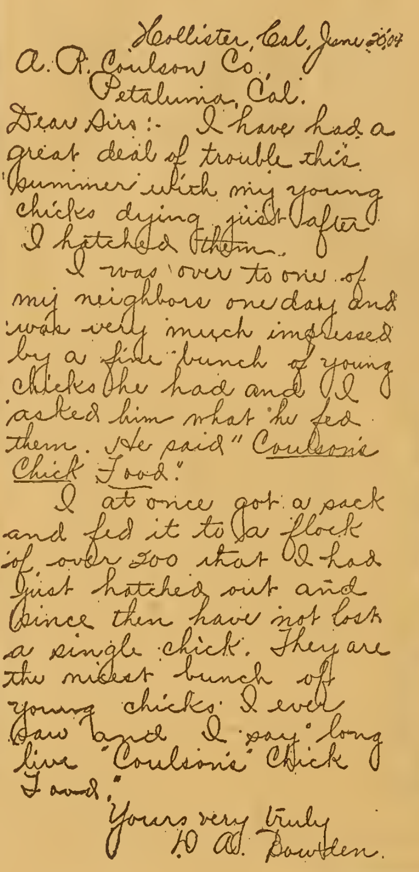
Coulson's Growing Chick Food



Hollister, Cal, June 20, '04
A. R. Coulson Co.
Petaluma, Cal.
Dear Sirs:- I have had a great deal of trouble this summer with my young chicks dying just after I hatched them.
I was over to one of my neighbors one day and was very much impressed by a fine bunch of young chicks he had and I asked him what he fed them. He said "Coulson's Chick Food."
I at once got a sack and fed it to a flock of over 200 that I had just hatched out and since then have not lost a single chick. They are the nicest bunch of young chicks I ever saw and I say long live "Coulson's Chick Food."
Yours very truly
H. A. Bowden.

Puts your chicks ahead of all competition distanced. A complete and perfectly balanced ration for growing chicks, etc., ground grains, seeds, blood, bone and meat, etc., allcombined. It puts the flesh on them it's wonderful how it makes chicks grow.

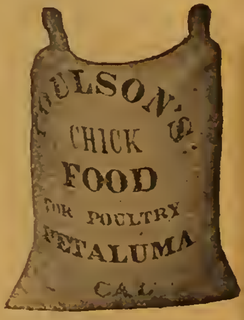
After the chicks get to be three or four weeks old, it will be essential to give them a meal once a day of Coulson's Growing Chick Food, and when they get to be six weeks old. feed them two meals of it a day.

The Growing Chick Food is of a different combination than the baby chick food. The Growing Chick Food is ground up more like meal. It is a stronger ration. containing more Fine Meat Meal and Dried Blood, etc., so it is more of a forcing food for the growing broilers—makes the chicks heavier and plumper and makes them develop rapidly.

Mix some of the growing chick food with milk or hot water, and manipulate it thoroughly and feed in a crumbly. not sloppy, condition. Another way is to take a panful of the Chick Food and bake it over night. Then the first thing in the morning crumble it up and give it to them.

Raised on Coulson's Chick Food. Showing One of the Colonies of Pullets, 3½ months old.

Plant of Armour Packing Company Where the Beef Meal is Made That is Used in Making Coulson's Chick Food.



Why You Should Use Coulson's Growing Chick Food

Common grain or chick foods, as a rule, contain too much fat-forming and not enough bone and muscle forming elements, and in consequence, the chick develops indigestion and diarrhoea, and soon dies.

If you will Feed Coulson's Growing Chick Food to the chicks they will be fully nourished, as this food is a complete properly balanced ration, all mixed, ready to feed.

Coulson's Chick Food is not very expensive. It is much cheaper to feed Coulson's Chick Food and raise big, strong chickens, than to feed by guess, a little of this and a little of that and not raise more than one-half of them. Remember Coulson's Chick Food contains everything required to fully nourish the chicks for the first two or three months.

All the trouble of hatching chicks is wasted if they don't live and grow.

If you like to see chicks dive into the feed as though they like it; you want to see the little chicks always spry and healthy; if you want them to grow rapidly and mature quickly;then you want to feed them the first three months on COULSON'S CHICK FOOD and you will be pleasedwith the way your little chicks are growing. It will raise the finest and largest chicks.

If you are going to raise any chicks this year, give it a trial.

It is composed of the best seeds and grains and PURE ANIMAL FOODS. A complete and perfectly balanced ration for growing chicks.

Coulson's Growing Chick Food analyzes about 18 per cent. protein. 60 per cent. carbo-hydrates. 7 per cent. minerals, 5 per cent. fat.

Coulson Poultry and Stock Food Co.

Treatment for Grape Vines and Fruit Trees

Employment of Sulphate of Iron in the Treatment of Chlorosis and Anthracnose in Grape Vines and Fruit Trees

"Bordeaux mixture for the leaves, with sulphate of iron for the roots, is the combination for grape growers.—French works.

Chlorosis is a disease itself or the evidence of disease. The distinctive signs of chlorosis in grape vines and other plants consists in the stoppage of growth, twigs remaining thin, the leaves turning yellow and the plant becoming barren.

Gris in 1849 showed that chlorosis is due to lack of iron. In 1869 Sachs called attention to the necessity for iron in healthy plant growth.

The disease has been traced to too rapid growth, poorly aerated soil, excess of lime in the soil. There remains obscure causes for the disease.

Sulphate of iron is in most cases a sure cure for the disease, and the consumption of this material in Europe has reached enormous quantities.

Rassiguier discovered a simple and practical method of combating the disease, which may be best given in his own words:

"The treatment with sulphate of iron, as an antidote to chlorosis, which I invented in 1891 and tried on my own property. has furnished such results that the method has spread and experience has taught its value to both scientists and practical wine growers.

"For the benefit of those who are still unacquainted with the details of the matter, I will briefly review the conditions to be followed as to the time, method of operating and quantity of dressing to apply, and recount the influence of a single annual washing on chlorosis. anthracnose and "short node" on vines, fruit trees and roses.

"To produce the full effect, washing should be performed in autumn. the vines most afflicted with chlorosis being treated first, as soon as the first leaves begin to fall; in fact, I think that such as are very much stunted should be treated before any of the leaves come off. Both are washed immediately after each stock has been pruned.

"All the wounds made in pruning should, without exception, be drenched with the iron solution and, in order to ensure the curing of the disease, the drenching should extend over the whole surface of the trimmed shoots (not excepting the buds, these being sufficiently protected by their downy envelope), the branches. and even the stem, as will be explained below.

"There is no need to be afraid of a more or less deep coloration of the trimmed shoots, and if any of these—insufficiently ripened, and therefore liable to perish—should succumb to the washing process. their place will shortly afterwards be found taken by vigorous buds—beside or below the dead shoots—which will bear fruit the next year. All vines, well or diseased. may be washed with advantage, as the treatment strengthens growth.

"If postponed until cold weather sets in the washing will have little effect, and spring washing is less efficacious against chlorosis than autumn washing.

"An active laborer with a wooden pail and a brush or, better still, a woolen rag tied up in the shape of a brush, can wash after three pruners. The solution should be a saturated one, i. e. containing 40 to 45 per cent of sulphate of iron, and may be prepared in a very simple manner by placing 80 to 90 pounds of sulphate of iron in a wicket basket or jute bag slung on a stick and suspending in a vessel large enough to hold 200 gallons of water without overflowing when the basket is immersed. After leaving overnight the sulphate will be dissolved and the liquor ready for use the next day.

"Generally the results of the treatment are remarkably beneficial, and in many places a complete cure is effected the first year. However, some soils are less favorable to viticulture and require the treatment to be repeated. Chlorosis has also been cured in fruit and rose trees by washing the pruned surfaces with the same solution.

"Moreover, when the dressing is applied over the entire surface of the stock, it is capable of destroying the germs of oidium, anthracnose, mildew and insects lodged in the interstices of the bark.

"Three years' consecutive treatment of my own vines cured the short node, i. e., those where the nodes on the stock branches were only a few centimeters apart. These formerly unproductive stocks now yield a large crop, and the internodes are of ordinary length.

"First year's grafts may be treated with a 20 to 30 per cent solution. the full dose being repeated the third or fourth year.

"Thus all the foregoing maladies are curable by a single annual operation.

"I recommend the pruner to cut through the middle of the bud just above the one destined to bear fruit, so as to leave intact the protecting septum existing at this point, and which, when cauterized at the surface by the action of the sulphate of iron, preserves the adjacent internode from the effects of frost, insects or wet, which might otherwise penetrate the pith; this internode remaining healthy, the fruit bud will be rendered more vigorous."

Anthracnose or birds' eye rot of the grape.—This fungus disease and its cure is so well described by Prof. O. M. Morris in Bulletin No. 64 (Jan.. 1905), of the Oakland Agricultural Experiment Station, that we quote the article entire:

"This disease is scattered over a large portion of the territory and is doing a great deal of damage. It is one of the worst of plant diseases, as it attacks the fruit and all green portions of the plant and is very difficult to handle. Most of the methods of treatment prove unsatisfactory. The first appearance of this trouble should be vigorously met and all possible care taken to prevent its spread.

"This disease may appear at any time during the growing season. It commonly appears on the shoots soon after growth starts in the spring. Its presence on the shoots is first indicated by the darkening and sinking of the bark in small oval or oblong spots extending lengthwise of the shoots. If the disease is abundant the shoots soon have a speckled appearance. These spots usually enlarge, the greater portion remaining black with a more or less distinct line of purple around the edge. After a time the center turns gray and forms a scab; this is the fruiting of the disease. Limbs badly affected are severly checked in growth or killed. The leaves are attacked and on the stem and vines show the same marks as on the shoots, but on the blade of the leaf the spots turn brown. The stems of the clusters are also attacked, and where the spots girdle a stem the fruit does not ripen but remains green and withers.

"The disease usually appears on the berries when they are about half grown. The diseased portion is brown with the characteristic red or purple margin and round in outline. The discolored part is sunken and later turns to a lighter or gray color, which is caused by the fruiting portion of the fungus rupturing the skin and forming a scab. Some varieties are more susceptible to the disease than others. Among those most susceptible to its attacks are Goethe, Agawam, Vergennes and Diamond.

"Treatment should begin early, before the buds open in the spring. The following solution is very good to apply as a wash before the growth starts in the spring:

"Sulphate of iron, 70 lbs.

"Sulphuric acid, 1 pint.

"Warm water, 16 gallons.

"The acid should be poured over the sulphate of iron crystals and then the water added. This. if well applied, will kill all of the spores that have lodged in the vines over winter. When this solution is used the vines turn black, and any part of the vine that has not turned black within a day or two after the first application should be washed again. Bordeaux mixture is of value in holding the disease in check on the growing vines."

Experiments on replacing in fertilizers "super-phosphate" with "mineral phosphate" plus sulphate of iron:

The experiments were made in a French wine vineyard by M. Bisset. The fields previously had received a dressing of horse manure. Beginning in April, 267 lbs. per acre of the following six fertilizers were used on the different experimental plots. and with the following results:

"Superphosphate" Fertilizers.

Composition.	Yield of wine per acre in gallons.
110 ℔ superphosphate 20%; 110 ℔ nitrate of soda...	961.9
81.4 ℔ superphosphate 20%. 55.0 ℔ nitrate of potash, 41.8 ℔ nitrate of soda, 41.8 ℔ sulphate of potash	961.9
79.2 ℔ superphosphate 20%, 70.4 ℔ nitrate of potash, 70.4 ℔ sulphate of potash	908.5
	2832. gals.

"Mineral Phosphate" Fertilizers.

132 ℔ mineral phosphate 17%, 110 ℔ nitrate of potash, 22 ℔ sulphate of iron	1389.4
96.8 ℔ mineral phosphate 17%, 55.0 ℔ nitrate of potash, 41.8 ℔ nitrate of soda, 41.8 ℔ sulphate of potash, 22 ℔ sulphate of iron	138.
94.6 ℔ mineral phosphate 17%, 72.6 ℔ nitrate of potash. 70.4 ℔ sulphate of potash. 22 ℔ sulphate of iron	940.5
	3719.3 gals.

The Comice Agricole de Libourne (France), experimented with a plot of vines using the following fertilizer:

Dried blood....................	89.2
Superphosphate	223.0
Sulphate of Potash..............	223.0
Sulphate of iron................	44.6
per acre	579.8

The fertilized plot produced 142.8 gallons against 121.6 gallons from the unfertilized plot, an increase of 21.2 gallons.

The "Journal de la Vigne " (France) cites the above formula as being used in Gironde for rich deep soils, while for poor soils the following fertilizer is used:

Dried blood	428.3
Superphosphate	374.7
Chloride potash	107.0
Organic matter................	53.5
Sulphate of iron...............	160.5
per acre	1124.0

M. Andourd, Director Agricole Station Loire Inferieure. gives in the Bulletin du Syndicat des Agriculteurs del, Inde the following formula for a grape vine fertilizer:

Rock phosphate 15%....	446.1	
Sulphate of ammonia....	89.2	
Sulphate of potash......	133.8	
Plaster	446.1	
Sulphate of iron.........	178.4	356.8
Per acre	1293.6	1472.0

Deciduous Fruit Culture

BY J. W. MILLS, POMONA, CAL.

BEST WATERMELON FOR HOME GARDEN

Editor, Cultivator:—Kindly tell me through the columns of your valuable paper a good variety of watermelon for the home garden and how to grow same.—R. T., San Francisco.

The Augusta Round White melon is considered the best for the home garden. It is too tender for shipping. Next to this we would plant the Chilian. It is dark mottled green with blood red flesh and is a good market melon. Perhaps the best.

A sandy loam produces the best watermelons. Plow it early and let it take in all the spring rain. Keep it well cultivated up to planting time which should not be earlier than the middle of May. Keep well hoed and cultivated till the vines interfere.

* * *

TO OBTAIN LAND IN IMPERIAL VALLEY.

Editor Cultivator:—Will you kindly tell me the terms they sell land on in the Imperial Valley? Does the water go with the land and is the title good?—T. J. B., Forestville.

The only way you can get land in the Imperial Valley is to buy water stock, the land is thrown in. If you file on Government land, it will cost you $1.25 an acre, but you must have water stock for it before you can prove up on it. Your water stock will cost you different prices. Farmers have improved their land and in some cases ask a higher price for it than does the California Development Company. There are perhaps some tracts of land which will sell with its water stock for less than it cost. but usually such land is dear at any price. Titles are good as the land was opened up under the desert land act.

The Imperial Valley is a vast country, and the only way for a prospective buyer to do is to go there and stay long enough to find out the advantages and disadvantages of the different tracts of land.

* * *

BEST WALNUT FOR MICA SAND

Editor Cultivator:—What is the best kind of walnut to plant on N. P. mica sand, 75 feet to water? Walnuts and fruit do well. but late frosts are bad there. How to select the seed is what I want to know. What kinds of peaches, prunes, apples and cherries are the best.

The best walnut for your situation is Franquette. It is a very late bloomer, and perhaps the finest type of nut grown. It, however, is not as prolific as some of the other varieties, but it will not be caught with the frost as often as other kinds. It will bring better prices than the Santa Barbara Soft Shell.

We cannot recommend a list of fruit trees for such land, but suggest that you try Salway, Lovell and Belle of Georgia peaches. Red Astrachan, White Winter Pearmain and Missouri Pippin and Bellefleur apples. We do not think you can raise cherries there, but would suggest you try a few Rockport Bigerreau. The common French prune, either D'Ente or Robe de Sargent. For home use, fresh. a couple of trees of Tragedy prunes are very fine.

* * *

APPLES IN CALIFORNIA.

Some years ago Mr. C. H. Rogers, an authority in California on the apple, stated in a paper before the State Fruit Growers' convention that the apple was adapting itself to the widest range of latitude and condition. but that it required certain surroundings to attain its highest degree of perfection. His observations had convinced him that the apple required a deep rich soil and a cool climate. Such conditions, he says, are found mainly near the coast and in the mountains of California.

The climate of a certain belt of the whole western slope of the Sierras is particularly adapted to the growth of the Baldwin, Spitzenburg, Hoover, Ben Davis, Winesap, and Greening. This belt, he says, varies somewhat, according to latitude. In the north, it might be given as ranging from 1500 to 3500 feet above sea level and gradually increases in altitude as the south is approached, until 2000 to 4000 feet about reaches the limit, while at the extreme southern limit of the State the latitude should be between 2000 and 4000 feet. The favorite varieties in the last named section are Duchess, Jonathan, Greening and Bellefleur.

In the coast counties some of the finest apple orchards are located within a short distance of the ocean and at an elevation of but a few feet, and while along the coast choicest red varieties may be raised, such as Spitzenburg, Jonathan and others, they may be raised as high as 3500 feet elevation. On account of climate variations the limit at which any variety may be depended upon to yield a full crop yearly is about 2000 feet above sea level. the yellow varieties, such as Newtown Pippin, Bellefleur and White Winter Permain are not profitably grown above 300 to 500 feet above sea level because of the prevalence of apple scab and other fungus.

The climate of the hot valleys does not prove conducive to the best results with the winter varieties. For these reasons, the commercial orchards have been confined to the more favored localities where late varieties flourish best. The leading apple district in California is Pajaro Valley, two-thirds of which is located in Santa Cruz County and the balance in Monterey County. This valley produces for export more apples than all the rest of the State combined, or fully 90 per cent of the outside shipments. It opens out upon the ocean. insuring coolness of climate and an annual rainfall averaging over 20 inches together with the water table ranging from 10 to 20 feet below the surface, insuring sufficient soil moisture, a soil of great depth and unusual fertility.

FRUIT IN SOUTH AMERICA.

A recent bulletin gives an account of the climatic and soil conditions of Argentina, and the production. culture, and export of fruit.

From recent statistics it appears that there are about 200,000 acres planted with fruit trees and 120.000 acres planted with vines. Of the different fruits grown, exclusive of grapes, peaches constitute 40 per cent. citrus fruits 20 per cent., figs and apples 10 per cent. each, pears, quinces, and plums, 5 per cent. each, cherries and all other kinds of fruits. including nuts. 5 per cent. It is thus seen that the peach is the principal fruit of the country. Plums also do especially well, but apple and pears are of minor importance.

The supervisors of the Oroville district are preparing to make a new county road to include the fine road that has been under construction by the Western Pacific up the Feather River canyon for several months. The road will be forty miles long and will have an easy and uniform grade and good bridges. It is built along the steep walls of the canyon and will cost in the neighborhood of $500,000, which the Western Pacific will pay.

Practical Farm Science

SOIL INOCULATION.

In Bulletin 68 of the Oklahoma Station is recorded the results of a series of pot experiments with sterilized soil to study (1) effect of cultivation and composition of media on the activity of the germ from the alfalfa plant; (2) nature of the organisms from the cowpea and the soy bean, and of a commercial culture; (3) cross inoculation, or the inoculation of one plant with cultures obtained from another; (4) normal distribution of the tubercle-forming bacteria of the legumes in the United States; (5) ability of the tubercle-forming bacteria to increase the nitrogen content of culture media in which they are grown; (6) methods of sending out cultures; (7) cultural characters of the tubercle-forming bacteria of the legumes.

Methods of determining nitrogen in the cultures and the results obtained in a series of analyses are also given, as well as the cultural characteristics of the tubercle-forming bacterium (Pseudomonas radiciola) of legumes. The results obtained are believed to justify the following conclusions:

"(1) Soil inoculation with cultures of the tubercle-forming bacteria is practicable only when other conditions are favorable for plant growth.

"(2) It is possible to grow these bacteria for at least thirty to thirty-five generations on special media without materially lessening their activity.

"(3) Some cultures examined in the laboratory purporting to be cultures from the alfalfa plant do not contain the germ from the alfalfa plant at all, but are cultures of a soil organism resembling the germ from alfalfa in some particulars.

"(4) The tubercle-forming bacteria of the legumes are easily destroyed by light. consequently inoculated seed should be kept in the dark until used.

"(5) Some of the ordinary soil bacteria form colonies very similar to those of the tubercle-forming bacteria and also resemble them to a certain extent in being vacuolated. every culture, from which subcultures are to be made for distribution, should be tested in pot experiments."

FERTILIZERS FOR ASPARAGUS.

Salt was long considered an essential fertilizer for asparagus. The natural habitat of asparagus is the seashore. and it was reasoned, therefore, that salt was beneficial to this crop. In modern commercial practices, however, beds of asparagus have been found to yield as well without salt as with it. and this has raised the question whether the use of salt is to be considered essential in the culture of asparagus.

E. Walker has recently made an experiment to determine the value of salt in asparagus culture. One-half of a bed containing one-seventh of an acre was fertilized with salt at the rate of 1000 pounds per acre. The asparagus field was in its second year at the time the experiment was started. As far as could be seen there was no appreciable effect of the salt upon the growth of the asparagus nor in preventing the growth of weeds. The following spring that portion of the field which had received salt the preceding summer was again salted, and this time at the rate of 2 pounds per square yard. The salt was applied in two equal portions at intervals of 20 days. With each variety of asparagus larger stalks and an increased yield was secured where the salt was applied, the average increase being 13.5 per cent in favor of the salted area. Not only was the growth of the stalks increased in the spring. but there was also an increased vigor in the plants throughout the summer and a notably increased glaucous appearance in the salted plants. The salt was entirely effective in preventing the growth of weeds. On the salted area without any hoeing but a few weeds appeared, and those late in the season. This beneficial action was believed to have been beyond what might have been assigned to the salt in simply preventing weed growth. ts indicate that while in the field culture of asparagus salt may not be especially useful, in the small garden patch, where intensive culture is practiced and where large amounts of stable manure are applied each year it may answer a very useful purpose. especially in keeping down weeds.

There has been some question as to whether or not early spring applications of fertilizers will affect the yield of merchantable shoots the same season. As is well known, the food supply of the first shoots to appear in spring is largely derived from food stored in the roots the preceding season. C. P. Close reports the results of an experiment in which the value of spring applications of nitrate of soda were studied. In the experiment a half acre of asparagus was fertilized with 100 pounds of nitrate of soda, which was applied in four equal portions, at intervals of about 10 days. The first application was made about 10 days or two weeks before the cutting season began. Another half acre was left unfertilized for comparison. The yield of stalks from the fertilized plat was 460 pounds and from the unfertilized plat 448 pounds. a difference of only 12 pounds in favor of the fertilized plat. This slight difference might or might not have been due to the use of the fertilizer, but "even admitting that the gain of 12 pounds is due to the 100 pounds of nitrate of soda used, it is not enough gain to justify the use of the fertilizer. The station concludes that " the use of nitrate of soda on asparagus beds during cutting season can not be recommended." On limited soil nitrate of soda has proved nearly twice as valuable a fertilizer for this crop as sulphate of amonia.

ORANGE-GROWERS have discovered by actual tests that a fertilizer containing not less than 12 per cent. of POTASH (in the form of sulphate) insures the most abundant yield of finest fruit.

Our books on successful fertilizing are free to you, without cost or obligation, if you will write for them.

California Horticulturally

BY JOHN ISAAC, SACRAMENTO, CAL.

SAN JOSE SCALE IN THE EAST.

California has received from the East very many serious insect pests, but she certainly got even for all this by sending the San Jose scale in return. We remember some 25 years ago what a serious afflictions this insect was to our orchardists, and for a time it looked as though the fruit industry in our State would be ruined by it. Every possible endeavor was made to circumvent its action and to discover some way of checking its spread, and out of this came the salt, sulphur and lime wash, which is still one of our standard remedies. After a time it was discovered that the pest was disappearing, even in locations where no efforts had been made to check it, and investigation showed that this work was being done by a little internal parasite, which has now so nearly overtaken the scale that we no longer look upon it as a serious pest, for while there are occasional outbreaks of it in limited areas, it soon disappears before its little foe. Of late years the San Jose scale has got a foothold in the orchards of the East, and it has spread over enormous tracts, destroying everything in its track, and no efforts seem competent to check it. Trees by thousands have been dug up and destroyed in the hope of staying its progress, but without avail, and every year complaints are made of its terrible destruction and its appearance in new districts. The same parasite which has done such good work for us in California exists also in the East, but owing to the shortness of the season there it has fewer broods than here and hence has not yet increased in sufficient quantity to overtake the scale, which seems to keep well ahead of it. Efforts have been made by the Department of Agriculture to introduce a predaceous lady-bird which should prey upon it, and while good reports have been made of its work, it has not yet proven efficient as a check. In the meantime the San Jose scale is with our Eastern friends what it was with us a quarter of a century ago, a difficult and costly problem, and emphasizes the fact that it is cheaper to keep out pests than to get rid of them when they once get a foothold.

STIMULANTS FOR SEEDS.

The possibility of stimulating the germination, especially of old seeds, and promoting the growth of plants by treating the seeds before planting with various substances, has been the subject of a number of studies both abroad and in this country, which have yielded results that promise to be of practical value. It has been repeatedly observed that certain of the treatments used in prevention of smut (for example, use hot water and copper sulphate) appearently stimulates germination and growth and result in a greater increase in yield than can be accounted for simply by the influence of the treatment in preventing disease. G. E. Stone and associates, of the Massachusetts Experimental Station, have shown that such results may be obtained by means of treatment with a variety of chemical solutions as well as by electrical stimulation of the seed. Of the experiments conducted in this country those made by F. A. Waugh, of the Vermont Experiment Station, and later repeated at the Massachusetts Experiment Station, have given results which promise to be of most practical value. Professor Waugh's experiments, which were begun as long ago as 1896, were based upon the assumption that the transformation of the starch in the seed is an essential process in germination, and that the so-called enzyms, such as diastase, which are especially active in bringing about such transformation, would probably aid germination when used in the treatment of the seed. He therefore soaked old and fresh seeds of different kinds in solutions of diastase and similar substances before planting. He found in general that the percentage of germination and the vigor of the young plantlets were increased by such treatment, diastase, either from malt or from various commercial preparations, being especially active in this respect. He found that tomato seeds responded especially well to the action of the diastase.

In his more recent experiments, Professor Waugh treated tomato seeds of different ages not only with diastase but with malt extract and with beer, which contain a certain amount of diastase. He found that the germination of old seeds was greatly promoted, and the vigor of the plants was increased 600 per cent by the diastase treatment. Similar results, though less marked, were obtained with fresh seeds. In all cases the plants were more vigorous, and apparently more resistant to disease (damping off). The results in general indicate that this method of treatment may be profitably employed if a cheaper source of diastase than that now available can be secured.

The results obtained in these expriments confirm those by Jensen in experiments made in Sweden with oats and barley. He found that treatment of the seed grain with a weak extract of malt gave an increase in the yield obtained at harvest time in comparison with seed treated with water only, showing that the extract produced an increased vegetative energy.

Several results are reported by Breal and Giustininani, of France, with, however, a very different method of treatment, as follows: The seeds were placed in a solution containing from one to five parts per thousand of copper sulphate, in which was stirred while boiling 2 to 3 per cent of starch. After cooling the mixture, four to five times its weight of seed was placed in it, thoroughly mixed, and allowed to remain for twenty hours, after which the seed was dusted with lime and spread to dry. This method of treatment increased the yield of all the crops experimented with, including corn, wheat, barley, oats, lupines, and buckwheat.

These various experiments encourage the hope that some of these methods may eventually be profitably applied in practice in certain cases, especially in the stimulation of old seeds and others of low vitality. Many important details, however, remain to be worked out before any of the methods proposed can be recommended for general or extended use.

BUDDING.

The seedling orchard is doomed, except under peculiar circumstances and conditions, as the fruit can not be laid down on the Eastern seaboard in competition with foreign fruit, and the Middle Western States is the only place where a market can be looked for, and other varieties of budded fruits are somewhat taking the place of the seedling. Nevertheless, a good seedling at its best is the equal in quality of any other variety, not excepting the matchless Navel. April is one of the best months for budding and changing over the choice kinds.

Whether the Navel can be grown with profit and success outside of the Pacific Coast remains to be proven, and it may be that our climate has something peculiar about it that makes such a luscious fruit from blossoms so imperfect that they will not produce seed.

ABOUT BUDS.

In changing very old trees it is most important that the right kind of buds be obtained, as much of the success can be attributed to the character of the bud. In budding on young wood almost any kind of a bud will take and do well, but where the bark to be budded is several years old, a small bud will be completely buried and have hard work to make a start, therefore, for this class of work, buds from vigorous suckers are generally chosen, and such may be depended on to set and commence to grow. It has been generally held by budders that when once a bud has started on the sucker it is useless to try to insert it and expect it to grow, but our best budders now assert that this is no hindrance but rather the reverse, as it shows an active bud ready for work and full of resources as one start does not by any means exhaust the possibilities of the bud. In Florida where the conditions may be more favorable, it is said to be not at all uncommon in budding old trees to take a young shoot in place of a bud, which, being at the time active, is so far on the way to success.

MOVING ORANGE TREES.

Although in the early days of planting orange trees all were moved with naked roots and had often to be carried fifty or a hundred miles in the hot sun and dry atmosphere by wagon, as it was before the days of railroads, success generally crowned the efforts of the planter. Perhaps one reason of this was that plantings at that time were small, holdings being counted by the trees rather than by the acreage. The Wolfskill orchard, where now the Arcade depot in Los Angeles is located, consisted of 2000 trees and was noted far and wide for its size and the immense profits realized from the fruit. Then oranges were counted by the number of the fruit in place of the box or carload, and the only market was on the Pacific Coast by water carriage. But this is a digression.

Although success generally follows the efforts of the careful man who moves his trees with naked roots, it will be found that with naked roots the earlier in the season they can be moved the better will be the results. Balling for short distances and sacking for long distances is the safest way and the expense is but a trifle more than the old method.

FERTILIZER TERMS.

Nitrogen—A constituent of the air and the principal fertilizing element in cotton seed meal, nitrate of soda and stable manure.

Ammonia—A compound of nitrogen and hydrogen in the proportion of 14 parts nitrogen to 3 parts hydrogen. Fertilizer analyses usually give the percentage of nitrogen and its equivalent in ammonia.

Nitrate of Soda—A mineral product obtained in Chili, South America. It is very quick in its action on the growth of plants. As its name indicates it is a combination of nitrogen and soda.

Sulphate of Ammonia—A combination of sulphur and ammonia and much used as a fertilizer.

Nitrogenous—Pertaining to or containing nitrogen.

Nitrogen is the element which peas, beans, clovers, vetches, etc., gather from the air.

HAWAIIAN ORANGES.

Over two thousand boxes, containing one hundred and thirteen thousand oranges, went up in smoke from the classic Iwilei district yesterday. The fire department was not called out, and no attempt was made to save any of the oranges. In fact, Mr. Alexander Craw, Superintendent of the Division of Entomology and Chief Inspector under the Board of Agriculture and Forestry, caused the oranges to be annointed with two cases of kerosene oil and himself lighted the fire which nipped in the bud the attempt of certain Japanese importers to defy the law which prohibits the importation of fruit infected with injurious scales, blights and insects.

As soon as the injunction was issued last Friday, prohibiting the importers and Deputy Sheriff Kalakiela from interferring with the Board of Agriculture in the discharge of its duties, Professor Craw and his assistant, Jacob Kotinsky, began a close inspection of the fruit.

They found ninety-nine per cent. of the oranges to be infected by thirteen varieties of dangerous scales. blights and insects, ONE A SPECIES OF LEAF HOPPER. and condemned the whole lot. Later the oranges were all carted to the Iwilei rubbish dump and there burned under Mr. Craw's supervision.—Honolulu Press.

ARE YOU READY FOR HARVEST?

There is a dignity about the International Harvesting Company advertising we are running which is befitting the subject. "Mother Nature has done her part. The fields are ripe. Are you ready for the harvest?" That is the dignified way the great Harvester Company introduces to our readers its excellent machines Champion, Deering, McCormick, Milwaukee, Osborne and Plano, which aid in the harvesting of so large a part of the grain and hay raised in America.

Readiness for the harvest is all important. As the grain and grass are ripe so are the machines ready and equal to do their duty. Nobody questions the superiority of the International mowers and reapers. They have all been tried in the field, all of them for many years. They represent individually the best skill and material and adoption to duty that the country has produced. Many other machines have been invented but most of them have disappeared. These have survived—a case of " the survival of the fittest." It remains for the farmer who has ploughed and sown and raised his crop to provide himself from the machines at hand the particular ones which he needs to enable him to harvest his crop quickly and surely and economically.

No word of ours could add to the reputation of the International Harvester machines. No word is needed. It is enough to say that no mistakes can possibly be made by purchasing any one of the six machines named. But the warning to get ready for the harvest is timely. International agencies are established at every considerable trading point to facilitate distribution and furnish supplies and repairs These agencies have catalogues and descriptive matter on the long line of harvesting machines and the company builds in addition to the mowers and binders. Farmers should call, procure the catalogues, make a study, of them and determine in time on the machines they will buy. Profitable farming demands improved machinery Buy all things that are standard and do it in time to have all things ready for the harvest.

Citrus Trees
——All the Standard Varieties——
Citrus Seed Bed Stock
B. C. Benner Nurseries - San Dimas, Cal.

GOPHER DEATH
Kills Prairie Dogs and Gophers of all kinds. Endorsed by Experimental stations U. S. and Canada. Approved by State Experimental Stations. Ready for use, 1400 delicate morsel, edible tablets for $1.25 delivered. One will kill a gopher. Warranted. Use before vegetation starts. Ask your druggist to get or send direct. RATICIDE TABLETS send Rats to rat heaven. 25c. Jobbers carry it. Booklet free. FORT DODGE CHEMICAL CO., 303 California St., San Francisco, Cal.

Tree Protectors
75c per 100. $5 per 1000.
As valuable in summer against sun-scald, hot winds, etc., as they are in winter against cold and rabbits. Recommended by all leading orchardists and horticultural societies.
Send for samples and testimonials. Do not wait till rabbits and mice ruin your trees. Write us today. Wholesale Nursery Catalogue now ready Write for copy. Agents wanted everywhere.

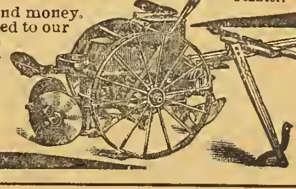
No. 6 Iron Age Combined Double and Single Wheel Hoe, Hill and Drill Seeder.

Your Spring Help
What kind of help will you have this spring. Will you do your work the old way with many men and much expense, or employ the time-saving, labor-lessening and money-making
IRON AGE Implements
These famous tools double each man's capacity—saving time and money. Our new No. 25 Fertilizer Distributor attachment may be applied to our famous No. 6 combined tool, or to our No. 1 Double Wheel Hoe as is the case with the Seed Drill attachments. This labor saving implement and the Iron Age (Improved Robbins) Potato Planter are fully described in "Iron Age" a book which should be in the hands of every gardener and farmer who would be more successful. Sent free.
NEWELL MATHEWS CO. Los Angeles, Cal



Iron Age (Improved Robbins) Potato Planter.

ORANGE TREES
Oldest Established Citrus Nursery in California, at Alhambra, Los Angeles County
Late Valencia and Washington Navels, Lisbon and Eureka Lemons. Guaranteed true to name. No better trees in this State. Lowest market price. Three-year buds, four-year roots. Horticultural Commissioner's certificate. Order early, as good trees are scarce. Inspection invited.
E. G. Wood, Owner, at Nursery or Room 732 Huntington Building, Los Angeles, Cal.

The Ornamental Garden

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

SUNFLOWERS VS. FEVER.

Consul-General Guenther, of Frankfort, writes that a Spanish professor, according to the German newspapers, has made the discovery that the sunflower yields a splendid febrifuge that can be used as a substitute for quinine.

More than ten years ago Moncorvo reported with reference to the same subject. Accordingly the sunflower should not only by its growing exert a great fever-dispelling effect but also yield a product which is used advantageously in malarial fever. The common sunflower is originally an American plant. Its original home is stated by botanists to be Peru and Mexico.

The Russian peasantry seem to be convinced that the plant possesses properties against fever, and fever patients sleep upon a bed made of sunflower leaves and also cover themselves with them. This use has recently induced a Russian physician to experiment with a coloring matter prepared from sunflower leaves, and it is stated that he had good results with it in malarial-fever cases. Moncorvo has also had good results with the coloring matter and with alcoholic extracts of the flowers and leaves. With 100 children from one month to twelve years old, he has, in the majority of cases, effected a speedy cure as otherwise with quinine.

SOUTH AFRICAN SHRUBS.

Halleria lucida, a scrophulariaceous shrub known as the African fly-honeysuckle, is still somewhat of a rarity though introduced to this coast some six years ago. It forms one of the neatest, cleanest shrubs we have, but most unfortunately it is known as a "shy bloomer."

A labiate quite common in California is Leonotis Leonurus, popularly known as the lion's tail. Lycium horridum, the African box thorn, a shrub often seen in the parks of Southern California, belongs to the tomato family (Solanaceae.) Acokanthera spectabilis, (Apocynaceae), and Asystasia bella completes a list of the better known Cape shrubs. The latter belongs to the order Acanthaceae and is best known under the name of Mackaya bella and with but few exceptions is so catalogued.

THE BOX TREE.

The boxwood tree (Buxus sempervirens), is a small evergreen seldom reaching over ten feet in California. It is a native of various parts of Europe and Asia. There are several varieties which are often cultivated for ornament, some with variegated foliage, and a very dwarf one, commonly employed for planting in continuous lines for the purpose of defining the edges of borders and walks in gardens, though never in extensive use in California. The wood of the box tree has long been celebrated for its hardness and closeness of grain. Its chief characteristics are excessive hardness, great weight, evenness and closeness of grain, light color, and its susceptibility to a fine polish. These are the qualities which render it so valuable to the wood engraver, the turner, the mathematical instrument maker, and others. The best is said to come from the vicinity of the Black Sea, and this formerly appeared in commerce in logs 4 feet long and from 6 to 9 inches in diameter. Some years ago both the dwarf and tree box was common in our nurseries, but of late years it has become quite scarce. Doubtless the air of California is too dry for its needs for in the damp climate of England and elsewhere, it grows luxuriantly, while with us the foliage burns if exposed to the full sun, and the tree always appears stunted.

INDIA RUBBER.

Ficus elastica, the India-rubber tree is a marked favorite in the more frostless parts of California, but in its native country it is looked upon only as the source of commercial rubber.

In tapping the trees the cuts are made at nearly right angles to the line of growth of the stem, aerial root, or branch at about 1.5 feet apart around half of the portion tapped. The cut is made only to the cambium layer. The overflow from the cuts is allowed to fall in mats made of thin strips of bamboo woven together. This drip rubber forms a kind of a skin over the mat and has a whitish appearance, whereas that which remains in the cuts has a reddish-brown color. The former, after drying, brings a slightly lower price in the market than that collected in the cuts.

RELIABLE NURSERY.

Buy your trees of the nearest reliable nurseryman. Then, if the varieties do not prove true to name, or if the trees are not what they were represented to be, you can take him to task and he will do the best he can to make it right. Men buy, through an agent, trees from a nursery several hundred miles away, when they could go to a nursery within a few miles and pick out trees of the varieties they wanted. Of course their high expectations were not realized, and nurserymen, the innocent as well as the guilty, are given all the blame. Mistakes will happen in the nursery business, as in all others, but there are honest men in the nursery business just as there are in all others, and by exercising a little care and caution you may find them, and you are pretty sure to get what you order.

CAPE JESSAMINE.

Some fine gardenias come from the Cape region, though strange to say the Cape jasmine (G. jasminoides) known usually as Gardenia florida is not native to Africa at all, getting its name from the fact that it was introduced to England by a sea captain who procured it in South Africa. The plant is a native of China. These plants must not be confounded with the true jasmines which belong to the olive family (Oleacae), for the Gardenias are rubiates.

OUR BEST PALM.

Phoenix Canariensis belongs to a genus of at least ten species, perhaps more, as botanists disagree as to what constitutes specific differences. Altogether about sixty species and varieties are known. The growth of the different species differ much. Some are almost stemless while others tower to one hundred or more feet. Some have claimed that P. Canariensis is a garden hybrid, though but little doubt exists on that question, botanists being fairly agreed that it is a native of the Canary Islands, from whence it takes its name. Of all the species so far known our subject is certainly the best for decorative use. In California it probably outnumbers all the others in the proportion of five hundred to one.

ELECTRIC LIGHT ON PLANTS.

M. Koller writes from Geneva that a remarkable example of the influence of electric light upon vegetation has been apparent this winter in several parts of the town. The Plane tree on the public promenades whose branches were illuminated by arc lamps, kept their leaves green long after the other branches were bare. On January 1 one could still see these green leaves on the trees that only frost has deprived of their beautiful covering.

We sell country lands. CHATFIELD & VINZENT, 228 Montgomery St., San Francisco, Cal.

Sycamore Grove Nurseries

We do Landscaping in all its branches, but also carry a full line of Ornamentals and Fruit Trees. Several different varieties of Acacias and Eucalypti. Send for our prices.

"PREMO"
SWEET CORN
IS READY TO EAT FIFTY DAYS AFTER PLANTING

Premo is adapted to the cold nights of the Pacific Coast—grows rapidly—produces abundantly. Will raise a fine crop of succulent, tender ears, under conditions that would stunt any other corn.

Premo bears an abundance of uniform sized ears—the kernel is crisp, creamy and deliciously sweet—is not tough or stringy. Premo is so hardy that it will bear planting two weeks earlier than any other Sweet Corn.

It pays Market gardeners to raise Premo as it is on the market three weeks before other varieties.

Prices: Sold only in sealed packages. **Pkt. 10c.—1 lb. 25c,** prepaid. By freight or express at purchasers' expense. **1 lb. 15c.—4 lbs. 50c.**

In the Vegetable Garden

BY ERNEST BRAUNTON

THE KIDNEY BEAN.

This species, with its numerous varieties. comprises all beans ordinarily used among us except the Lima bean. It is a native of a warm climate. probably South America, and was introduced into Europe in the sixteenth century. It was not known to the ancients. It has since become very important, chiefly because varieties of it are produced by the gardener and the quality thus improved by cultivation.

It is naturally a climber, but dwarf varieties have been developed which we call bush beans, which are used both as string or snap beans and as dried beans. This bean grows rapidly, flowering and seeding early. It has large. rough leaves. made up of three leaflets, and the butterfly shaped blossoms in clusters of from two to eight, start at the axils of the leaves. The pods and seeds are variously shaped and colored. The kidney beans may be divided into two groups —tough podded and edible podded. there being both bush and pole varieties of each group. A great number of varieties have been developed. each locality having its own favorites, and the tendency of growers to rename standard varieties of those which have developed only unimportant differences tends to confuse the nomenclature. The many "wax" beans belong to this species. Most of the "shell" beans which are eaten before fully ripe are of the pole varieties. The prejudice against beans that grow dark in cooking is unfortunate, since many of them are of fine quality and full flavored.

WINTER BLIGHT OF TOMATOES.

During the past fall a disease has come upon the winter tomato fields of the La Habra and other southern districts, and completely ruined them. In the district mentioned the shipments fell off within a very short time from 3,000 crates per day to practically nothing, and at a time when an increase should have been taking place. Many thousands of dollars were lost to the growers from this cutting-off of the crop just at the most profitable season. The disease which brought about this result may be designated by the above name according to the season of its occurrence, to distinguish it from the summer disease or blight. It may be said here that the Fusarium disease does not seem to continue into the fall, the late crops showing very little of this trouble.

After the heavy November rains of 1905 in Southern California, tomato picking and shipping were just approaching the height of the season. The vines were covered with green fruit, good returns had already been made, and an excellent prospect was in sight. Quite suddenly, however, in the early part of December or last of November, this winter blight appeared and ruined the crop. The period was one of warm days and cold nights, following heavy rain. The disease appeared quite differently from the summer blight. There was no wilting or gradual dying of the vines, but there first appeared dark, discolored spots on the fruit, stems, branches and leaves. On the fruit, a discolored, watery spot develops, usually on the upper side, and therefore mostly near the stem end. This increases quite rapidly, several spots appear on one tomato, and it soon rots and is spoiled. Fruit of all sizes is affected, from the smallest to that ready to pick. When sound appearing fruit is picked from affected vines, many of the tomatoes develop the spots and rot in the box within a few days. In moist weather a white, mildew-like mold comes out abundantly on the affected spots. On the stems and branches dark spots appear, and soon the whole vine becomes black and dead, with green tufts regaining here and there, exactly as though the field had been struck by frost. In many cases this blight was mistaken for the effects of frost, when no frost had occurred. In blighted fields the ground remained covered with tomatoes, all spotted, infected with rot, and worthless.

THE VEGETABLE GARDEN.

There is little danger of making the soil too rich for a vegetable garden, for vegetables seldom suffer at any time, in point of productiveness by reason of too rampant a vegetative growth.

The use of hand tools is unnecessary in the preparation of a seed bed if the soil is worked at the proper time.

The labor of hand weeding may be reduced to a minimum by planting in freshly worked soil only, tilling close to the rows early in the season, and permitting no weeds to ripen their seed.

The use of a wheel hoe saves labor in the care of a garden, even when much of the tillage is to be done with a horse.

The expense for labor in caring for a garden adequate to supply the needs of an ordinary family need not exceed twenty-five dollars a year.

The retail value of the vegetables which may be grown in a carefully planned and well kept garden greatly exceeds the cost of their production.

BEETS IN MICHIGAN.

Labor Commissioner McLeod of Michigan has isued a statement of the beet sugar industry of that state. The cost of the plants was $10,200,000, an average of $638,000 each. The aggregate acreage of beets raised in 1904 was 58,213, or 3,380 for each plant, and in 1905 was 79,457 acres, an average of 4,966. The acreage in 1904 produced 328,316 tons of beets, and the estimate for the 1905 season is 566,638 tons, the average tons per acre being 5.7 in 1904, and the average sugar percentage 15.2; for 1905 the figures are 7 and 15.2. Sugar made in 1904, 108,236,474 pounds, or 7,215,765 for each factory, and the corresponding estimates for the last campaign are 143,105,205 pounds total and 8,944,075 average.

POTATO SCAB.

Editor Cultivator: How can I treat my seed potatoes to make them immune from scab?—G. E. M., Monrovia.

Dissolve corrosive sublimate at the rate of one ounce to eight gallons of water and soak the seed potatoes in this solution for one and one-half hours.

A Great Money Maker for the Farmer and Gardener

Crimson Winter Rhubarb is Becoming a Greater Favorite Each Day, and an Unlimited Market Will Cause Greater Increase in its Planting

"Yes. I find Crimson Winter Rhubarb an exceedingly profitable crop. very easy to raise, very satisfactory to sell," remarked Mr. Chas. M. Braggs to the writer of this at Mr. Bragg's place near Garvanza last week. Mr. Bragg is not a grower of large quantities of the rhubarb, having only a total of 400 plants; but those 400 plants, which he placed in the ground last June, have brought to him since that time $150. The plants were secured from the nursery of Mr. J. B. Wagner of Pasadena.

Mr. Wagner has made a thorough study of this favorite plant for several years, his stock first being secured from the original distributor, Luther Burbank of Santa Rosa. Mr. Wagner secured the first 200 plants of this variety sent by Mr. Burbank to one party in Los Angeles County. This was five years ago; these plants are still producing enormously. It is doubtless one of the most successful of all Mr. Burbank's introductions, though it is probable that it is somewhat more limited in its field of general production than some others. The most favored location for this plant is California.

Mr. Wagner has taken pains to secure his seed from the original stock purchased of Burbank, which may be the cause of the large profits that come from planting of roots from his nursery.

We recently asked him as to the most favorable time for planting Crimson Winter Rhubarb and he said the present, or during March, April, May or June was the best time in the whole year. We note Mr. Bragg planted the 400 above mentioned in June. Every experience that we have heard has been that the first year's income has more than paid for the original investment of roots and the care of them for that year. As the life of the plant is said to be fifteen years. we may say, to express it mildly. that rhubarb culture "looks good to us."

The Cut on the Left Shows the Vigorous Growth of Stalks of Crimson Winter Rhubarb, While That on the Right Displays the Splendid Root System.

Regarding the market for rhubarb, there can be but little question, for as we know the field for culture is very limited and shipping quality is of the very best, and the "fruit," or stems' will bear shipment to any part of the United States. It is estimated that the city of Los Angeles alone will handle about seven car loads per week during the season, this being about the amount now used of the common rhubarb, so that as soon as the production of the superior article arrives at the stage which is beyond what local points can carry it will be comparatively easy to reach Eastern markets with the production.

The "fruit" is not only excellent for pies and sauce, and regarding both of these the writer can give the highest commendation, but it is also said to make one of the finest jellies, in which it is handled much the same way as currants or any other jelly producers.

Mr. Wagner not only has the original Burbank Crimson Rhubarb but on his large experimental farm at Pasadena he has all the leading sorts obtainable. which he is using for hybridizing or crossing purposes. He has thousands of these young hybrids on his test grounds, many of which show evidence of superiority. These he showed to Mr. J. C. Vaughan, president of the great Vaughan seed stores of New York and Chicago, who says the stems will average larger than any of the sorts common to the Eastern rhubarb grown. Mr. Vaughan also expressed a desire to secure the stock of this as soon as Mr. Wagner had it to offer, which will be at least three years.

Full information may be procured by writing him at Pasadena. He still has, we believe, some plants for sale, although the demand has been very heavy during the present season.

San Francisco in Ruins—On Wednesday morning at 5:16 and at 8:45 earthquake shocks destroyed the greater portion of San Francisco. Fire followed in awful rapidity and left nothing in its wake in the district bounded by the shocks. As we write this we are unable to give definite data, but the telegraph reports from 1000 to 1500 lives lost, 50,000 people rendered homeless and about $200,000,000 in property destroyed. The shocks were felt 75 miles around San Francisco, partially wrecking San Jose, and many smaller towns along the coast. Nothing like this catastrophe has ever befallen the Pacific Coast.

It is useless to moralize. We are stunned to silence by the awful calamity. The cause is attributed by scientists to be the internal cooling of the earth which perforce must readjust its surface.

* * *

Criticising the Court—The opinion handed down by the Supreme Court of California recently, declaring unconstitutional the law enacted by the last legislature, requiring producers of butter, offered for sale to stamp each package with its actual weight, has provoked sharp criticism in the newspapers, especially north of the Tehachapi. The San Francisco Chronicle leads the criticism and pronounces the opinion the "over-riding of the judgment of the legislature which passed the statute and the governor who signed it."

"The object of the law," says the Chronicle, "was to put an end to a petty fraud which is peculiar not only to California, but to California north of the Tehachapi." The rolls were originally two-pound rolls, but in recent years have been made smaller, but of varying weight, to suit the requirements of tricky grocerymen who buy by the pound, but wish to sell by the "roll." The law was popular with the public, with producers, and with wholesale dealers. All butter is sold by actual weight until it passes from the retailer to the consumer. It put an end to a gross abuse and was in every way a good law. It could not for any reason be objectionable to any one who did not desire to commit or abet a fraud. Some one, however, contested the law, and the Supreme Court has held it "unconstitutional." It also declared void a law forbidding the second-hand traffic in theater tickets, which is another petty abuse which the legislature attempted to correct. In both cases the court simply held that the law was an "unreasonable" interference with private rights.

Continuing, the Chronicle adds: "The Court held that its judgment of "reasonableness" must override the judgment of the legislature. We do not know whether the judgment of the Court was unanimous—it seldom is—but, assuming that it was, we have the judgment of seven men as against that of the governor and the 120 members of the legislature, and, we may add, ninety-nine-hundredths of the suffering public."

The question the people of this government is discussing right now, in connection with many such decisions by courts, is, how far is the will of the people of this age to be overridden by court judgment. No matter how imperative may be the need of legislative reform ,there seems to be some way to find an "unconstitutional" loophole to thwart this need. We anticipate such a finding if congress shall enact the rate bill.

Corporations will appeal and nine chances out of ten the Court will hold the law "unconstitutional."

In the case of the butter weight law and also in the case of the second-hand traffic in theater tickets, it is difficult to see where the laws so essential to public protection could be "unconstitutional." But the Supreme Court had the last say and it said enough to render both laws invalid. The Chronicle says in concluding its article: "But these laws were good laws, and if it was "reasonable" that such petty frauds should be suppressed, they were valid. And on that point the opinion of the public—when so nearly unanimous as in this case—is better than that of any "Court" on earth."

* * *

Orchard Vandals—The report comes from the orange growing district of Covina, that some one has been industriously spreading the purple scale on the trees. It would seem that such an act would be beyond the conscience of man to perform. It is the most criminal, act which can be conceived outside of wantonly barking or cutting the trees. When the county expends so great an amount annually to support a Horticultural Commission with its corps of inspectors, whose business it is to fight scale and pests, it seems impossible that any one could be found degenerate enough to engage in the work of spreading scale in the orchards. It could only be done for one of two reasons; first, a deliberate desire to do a great wrong—to get even with some person—or to make the work of the Horticultural Commission more exacting. There are many people who do not think the Horticultural Commission has much to do, that it is a sort of a political sinecure, held by local politicians and is of no particular value to the country. But however widespread may be this idea, where is there a man mean enough to perpetrate so gross a wrong simply to vent a personal spite on the Commission, or any private individual?

The orchardists of Covina ought to institute a thorough investigation to ascertain the cause of this unusual appearance of the pest and if it shall be found there is going on a systematic effort to infest the orchards with the scale, the guilty party should be hunted down and vigorously prosecuted. At any cost extreme care should be taken to fumigate the trees before the scale shall fasten itself on the district. The purple scale is the worst pest that infects the citrus trees, the most insidious and damaging and the most difficult to eradicate. It needs prompt treatment when it appears and should be treated effectively. The orange growers of Covina, however, are wide awake and will not sleep while this danger confronts them.

* * *

Fire Protection for Forests—The Cultivator has received a circular letter which E. T. Allen, the State Forester, has addressed to Boards of Trade throughout California, urging them to extend their efforts to put into active effect the law passed by the legislature last year, for the protection of forests of the State. It is to be hoped the appeal may receive the hearty co-operation of every Chamber of Commerce and Board of Trade in California, for the reason that heretofore our forest preserves have suffered incalculable damage from fires. The State Forester urges immediate action on the part of the bodies appealed to on the ground that forest fires cause a great loss of property and natural resources; have a damaging influence on investment values and insurance rates; are a menace to irrigation and power enterprises; threaten or cause large private losses annually, and attack the general prosperity and prospects of development and the tax revenues of the counties wherein they occur.

The law passed by the legislature provides for the co-operation of the county Boards of Supervisors with the State Forester for the organization and control of a forest-fire patrol in each county. The State Forester has the exclusive right under the law to authorize and empower the officials appointed by the Supervisors; but their pay, during the term of service, must be provided for by the latter. The State Forester emphasizes the fact that his "office is unable to support a local organization, and no local organization can have adequate authority" except through his office. "Together," he adds, "we can keep up a good system," which will afford due protection to the forests not included in the national reserves. He, therefore, appeals to the Chambers of Commerce and Boards of Trade to adopt a resolution recommending immediate action on the part of the respective Boards of County Supervisors as the dry season, when forest fires are prevalent, is close at hand.

Orange and Lemon Trees

Are the only kind of nursery stock we have grown for the past twenty years, and being the largest producers in the world we feel that we are in a position to render intending planters better service in the way of superior trees over all competitors. Our prices are right, considering quality.

Good Trees mean Good Profits

A poor tree is expensive as a gift, and an untrue-to-name plant an aggravation and waste of time, labor and money. When you plant an orange grove remember Davy Crocket's advice, "Be sure you are right, then go ahead."

We stand ready to prove to you that you will be right when planting our trees. Correspondence a pleasure, and our booklet on Citrus Culture is free.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

In one year Dinuba Station received 25 cars of grape stakes.

A large cold storage plant for fruits and flowers of latest design is being built at Chico.

A cluster of oranges containing nine, and weighing four pounds and ten ounces, on one stem. is being exhibited at Highlands.

The Porterville Realty Board has decided to hold an Eastern Tulare County Citrus Fair in Porterville the last week in November.

A compromise has been reached by the California wine makers and the wine interests of New York and Ohio under which the Fassett Pure Wine Bill will probably become a law in the interest of the grape growers of the section named.

The annual meeting of the California Fruit Growers' Association of San Francisco was held April 11th. The net profits reported over $463,985 and a surplus and reserve of this association now aggregating $1,161,770.

The manager of the Highlands Orange Growers' Association packed a box of oranges, 64 in number, on January 1st of this year. He left the box in the packing house for 90 days and on opening it only four decayed oranges were found.

J. H. Adams, one of the large oranges growers of the Covina district, is authority for the statement that some person is deliberately attempting to scatter throughout the orange purple scale, Mytilaspis citriola. He offers $1,000 reward for the arrest and conviction of the fellow.

The Tulare County Citrus Fruit Exchange has collected $4639.54 of old claims against the railroads since January 1st, 1905. Within the past five years about $12,000 have been collected in claims which have gone into the pockets of the citrus growers.

At the Chamber of Commerce, Los Angeles, last Saturday a joint meeting of directors of the eleven walnut associations of Southern California was held to fix prices for the current season, but that was deferred to a later date. The largest single detail of the meeting was the letting of the bag contract. The total of 105,000 bags will be called for to handle this year's crop.

AGRICULTURE.

The great sugar factory is being completed at Hamilton.

California asparagus has been selling for the fast few days in the New York market at 60 and 75 cents per pound.

The farmers around Chico and Hamilton are re-seeding their beet ground which was deluged with water during the recent heavy storms.

Santa Ana wants a pickle factory and also, says the Bulletin, a factory that will utilize those fruit and vegetable products which are now going to waste.

A Huntington Beach man planted last year 60 acres to beets. and the gross receipts from the crop totaled $7,500, and he expects this year from 120 acres to realize $11,000.

Mr. Lewis of Corcoran has 400 acres planted in asparagus, says the Hanford Sentinel. which is now two feet high and will soon be ready for cutting, when the profits will be very great.

Sacramento County Pomona Grange own their own picnic grounds and manage it under the Elk Grove Park Association. Last year the picnic netted $300 for the Grange, which now has $400 in the treasury.

The Los Alamitos Sugar factory management reports 7,000 acres planted to beets which promise the best yield in years. The factory will make a run of at least 120 days, and will be in operation about the middle of July.

The Hanford Sentinel says that 10,000 acres in the neighborhood of Corcoran have been irrigated from the waters of Cross Creek and Two Rivers, and the prospect is that 2000 acres more will also be wet. Corcoran is reaping the benefit of this surplus water.

The Adams bill providing for an increased appropriation to agricultural experimental stations at the 56th Congress will raise California's quota to $20.000 a year, available June 30th, 1906. Thereafter by a gradual increase the apropriation will be increased to $30,000 a year.

J. H. Roth of Rockyford, Colorado, the section famous for its canteloupes, is in California arranging for the planting of the genuine Rockyford melon, from selected seed, in all sections along the coast where melons can be raised to advantage. In San Diego County he succeeded in having planted 2500 acres in Rockyford melons.

An invasion of the army worm is greatly feared by the farmers of San Bernardino County. The pest has already made its appearance in great numbers. The seeds and tall grass should be cut immediately on the appearance of the worm and the ground thinly covered with slacked lime to the very edges of the parts worked by the worm and the ground thoroughly saturated.

LIVE STOCK.

California produced 42,000.000 lbs. of butter in 1905.

A freak of nature in the form of a two-headed calf was exhibited at Santa Maria this week.

The first creamery in Josephine County, Oregon. will be ready for business by the first of May.

Escondido shipped last week 219 cases of eggs. 2134 pounds of chickens, 2910 pounds of cream and 2249 pounds of butter.

The United States Department of Agriculture estimates the number of milch cows in California January 1st, 1906. at 390,115.

Southern California and San Francisco as well have been receiving carloads of dressed hogs from the East. This is an unusual condition.

Horses in Mendocino County have been afflicted this winter with a very peculiar mange which has cost many of them their manes and tails.

The Chino Champion says 4000 cattle from Utah will be fattened on pulp from the sugar factory this summer. It will require 140 cars to move the herd.

The Shasta County Live Stock Association held its monthly meeting at Redding last week and reports of the stock industry in that county were very flattering.

The price of mutton and pork keeps up, and the producers have not experienced such conditions for a long time. The price of mutton is almost double what it was a year ago.

A cattle grower named Williams in Monterey County will have shipped to his farm this spring 50 head of full blood Short Horn cattle. from which he expects to build up a very fine herd in the near future.

Secretary Hitchcock has recommended to Congress an appropriation of $30.000 for the purchase of heifers and bulls for issue to the northern Cheyenne Indians at the Tongue River Indian Agency in Montana.

The sugar beet field in the Santa Maria Valley will have an acreage of between 10.000 and 12,000 acres. The sugar factory will have an output this season of about a million bags. The run will begin in June and continue seven or eights months.

The common council of Marysville is arranging to systematically fight the mosquito plague again this year by oiling the water holes, the gutters, the mud holes, and the cesspools throughout the city. and the farmers of the county are preparing likewise to fight the pest in the interests of their stock.

Unsatisfactory market conditions and unjust methods of weighing cattle are responsible for the organization of the California Cattlemen's Association, which has for its president Mr. J. R. Hebbron of Salinas, and Mr. Wm. Pinkerton of Pleyto for its secretary. The principal objects of this association are: (1st) to secure protection from the "beef trust." (2nd) To obtain prices for live stock commensurate with the prices charged by the butcher. (3rd) To reduce the evil of sending cattle to the slaughterhouse to be killed on commission. (4th) To remedy the method of weighing cattle from the producer to the wholesaler.—Porterville Enterprise.

MISCELLANEOUS.

Castroville has organized a chamber of commerce.

L. P. Mitchell has purchased the Azusa Pomotropic.

Natural gas has been struck at Alamitos at a depth of 490 feet.

The Santa Fe Railroad Company is building a $10,000 depot at Corcoran.

The citizens of Redlands are discussing the feasibility of establishing a military school.

The Ukiah Times is earnestly advocating good roads and bridges for Mendocino County.

Capital has been subscribed for the establishment of a large cement factory near Hollister.

Santa Ana is to have a sewer farm with septic tanks. The cost of the tanks will be $1000 each.

J. H. Reed of Riverside is engaged in planting trees along most of the principal streets of that city.

Watsonville is already "hurrahing" for the biggest Fourth of July celebration to be held in theState.

The Jacinto Gun club is preparing for a shooting tournament to be held April 24th, 25th and 26th.

Covina will celebrate today with Arbor Day exercises, the planting of many trees on the public streets.

The city of Tulare has arranged for a flower carnival May 4th and 5th and anticipates a great crowd present.

The contract has been let for the construction of an electric railway between Marysville, Chico and Oroville.

An epidemic of bogus dollars has broken out at Marysville and the officers of that town are endeavoring to locate the maker thereof.

Live Stock and the Dairy

BY MRS. MINNA E. SHERMAN, FRESNO, CAL.

FILLING THE SILO.

The silo is filled with cut-up corn or alfalfa, or whatever crop has been intended for it, the cutter is set for a two-inch cut and the elevator is in place to take it to the top of the silo. As the teams must be kept moving busily all the time, it is better to buy a large sized cutter. one that has several tons an hour capacity, than to have the cutter so small that the teams must wait for it to take care of the corn hauled in. The new blower arrangement is said to be an improvement, and if I was buying a new outfit I should examine carefully into their merits before deciding as to which I preferred, the elevator or the blower. At present we are using the old elevator, because it is not worn out. The elevator was troublesome until we changed the chains for the simplest open link pattern that did not clog and collect a mass of corn that finally wrecked the link.

The traveling table works well with corn but clogs up with alfalfa so that it is useless to feed the cutter.

The engine must be a simple one, that the ordinary ranch hand can run. If it is necessary to pay a man with a certificate to run the engine it will usually result in the owner as a measure of economy, running the engine himself, and it is not pleasant work. I have not found anything as satisfactory as the old-fashioned thresher engine mounted on a horizontal boiler. This can be run on bundled vineyard brush, straw, or can be arranged with a crude oil burner. Four years ago the old Rice outfit, a relic from the days of grain farming, gave way to the improved gasoline engine and that in turn to an engine burning distillate; but a return to the old engine is contemplated with joy by the foreman.

The ordinary labor, meaning the men, the extraordinary labor, meaning the foreman and owner, cannot make the gasoline engine run with any degree of regularity. We have all heard how others start them off and never have to visit them except to see that they are oiled and have fuel. Well, ours have not been built on that plan; we spend most of our time visiting them, as they were always standing still waiting for a call from the town mechanic at $5 a day and car fare. This was increasing the cost of silage woefully. The cost of cutting, hauling and putting the corn into the silo with the old engine averaged for five years, amounted to one dollar and eighteen cents per ton, while the three years with the gasoline engine, it has risen to an average of three dollars and twenty cents per ton, and considerable loss of temper. The foreman pleads for the repairs of the old thresher engine and describes his woes as follows: "When the old engine acted cranky every one knew what to do, but when these new engines go queer, you do everything you have been instructed to do, and yet she stands still; then you take a monkey-wrench and hit her here and there all arounds, then you say your prayers and maybe she will start up, if you are not too great a sinner."

While the silage is being put into the silo the tramping must be well done, but I talked of that last week, and will not repeat it here.

After talking at the El Cajon institute, I found there they had better results from not wetting the silage. I told Carl about it when I came home. He has been here on the ranch 18 years and thinks that unless the water shows on the ground around the silo it is not wet enough. Now I think this man Carl knows, as he tramps the silage and later feeds out every foot of it to the cows. He watches for bad spots and then forms his conclusions and the next year tries to make it different. The filling of the silo goes on until ten or twelve feet are put in solid and the crew is laid off until the silage heats and cools until the arm can bear the heat at a depth of a foot from the top. When cooled down to this degree, or about 110 by the thermometer, and another ten or twelve feet is put on it, if the filling is done too slowly, the heat never rises high enough to cook the feed, and the silage is sour, while if it is filled to the top at once there is a mass that burns to blackness at the bottom and smells like burnt molasses. The cows do not care for this, and it is usually thrown on top the manure pile, though if it is not too bad some of them will eat it.

Good silage is the color of cooked cabbage. or about like sauer kraut in appearance, and should smell like fresh brewed grain. The tools we use in harvesting corn are not expensive, as the Eastern binders are too light to bind the corn grown in the San Joaquin, the old-fashioned corn knife has again come into use. A low wagon to haul corn is convenient and can easily be constructed out of a common farm wagon, the wheels and axles are taken from the reach and two eighteen-foot four by four, are chained together under the axles low enough to be about eighteen inches from the ground back far enough to clear the wheels; a bed is made of scantling, nailed four inches apart and this bed is seven or eight feet wide. In the field the horses move along and one man cuts, another catches the corn and lays it across the wagon bed. By the time the load is made up to the capacity of the wagon, it is not above the reach of a man standing on the ground. When it comes to the cutter it is easily taken off by tilting it over from the top on to the platform. Plenty of wagons are needed and a platform large enough to hold several loads of corn. The wagons start the first thing in the morning to the field and the cutter and tramping crew go with them. Everybody cuts and loads up the wagons. The first wagon in from the field takes two men with it and one remains at the cutting table to help unload the next wagon, so one man is there unloading and it is accomplished without waste of time and the wagon comes back promptly to receive a second load. After the first wagon arrives there should be a constant succession of arrivals at the cutter. When there are too many men standing around the money is being wasted. As soon as the cutting platform is full, then have the next wagon haul less corn, sending in the silo crew, leaving only the crew that is the regular corn gatherers at work. Start the engine, begin on the piled up corn. The secret of handling work is to move with a snap and do the work with a swing. The men will like to work for you if things move, for if they are worth anything as men, they hate to drag at their work. Now, after we have made a hard week's pull altogether, and the silo is nearly finished at Saturday noon, say to the boys; there is only a couple more hours' work ahead, and let's put it through and the time after we have finished is yours. You can quit when the silo is full and the teams are put away. A little appreciation like this and you find the laboring man of California full of response. They are faithful and if we are faithful to see life from their standpoint, few of the grievances that arise between the man and boss will be serious. Right doing and right thinking of them as fellow-beings and as being exactly like ourselves, makes them responsive to our wishes, and the work swings along "full of go."

BALANCED RATION.

Editor Cultivator: Can you give a balanced ration for a young Jersey cow which weighs about 750 pounds, that gives 25 pounds of milk, averaging five per cent?

The best ration we can suggest is a liberal supply of alfalfa, and a daily allowance of four pounds chop (corn-meal unbolted), three pounds of bran and one pound gluten feed, with daily salt about two ounces. Curry the cow with comb every morning.

Milk Coolers, all sizes, all prices. See O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

Cream Separators in Nebraska

Within a few years Nebraska has come to be the greatest farm cream separator state in the Union. According to a recent census of the Nebraska State Experiment Station nearly 35,000 separators are in use today among Nebraska farmers. Without doubt this is a greater number of machines by a large majority than can be found anywhere else in a territory of this size. This universal use of the cream separator in Nebraska speaks volumes for it as a money making machine for the farmer. More and more each year is the farm separator becoming a big factor in the prosperity of the country. Through its introduction in many instances large territories throughout the middle-west have been converted from practically barren wastes into prosperous farming lands. Thousands of farmers living in the corn and wheat belts who were formerly engaged in raising grain and general farming are today making a specialty of dairying simply because the farm cream separator has made dairying a great deal more profitable than general farming. From Maine to California a great wave of reform in dairying and farming methods is sweeping over the country, and the cream separator is back of it all. Cow owners everywhere are awakening to the fact that a good cream separator is as necessary an article on the farm as a plow. According to present indications more farm cream separators will be sold in 1906 than ever have been in any year up to the present time.

In this connection, as an item of interest to all, the Nebraska Experiment Station authorities are quoted as estimating that from 85 to 90 per cent of the nearly 35,000 separators in use in Nebraska are the famous DE LAVAL machines. These well known separators are universally used in every part of the world, and in view of the exceptional efficiency and the general satisfaction they give the user it is not surprising to find that over 85 per cent of the separators in use in Nebraska are of DE LAVAL make. A handsomely illustrated catalogue of the DE LAVAL machines and any desired information can be had for the asking by addressing

MODERN BUTTERMAKING

F. D. Curtiss, a Wisconsin dairyman, revolutionized buttermaking. In the Iowa Homestead. H. C. Bennett gives some of his methods. They are of interest to buttermakers. He rigged up a barrel, attached a crank with which to revolve it, and in his kitchen was born "granular buttermaking," and the sturdy Curtiss stood the acknowledged father of modern buttermaking. True, recognition from his own class of private dairymen was tardy, but creamery buttermakers took it up and gained so much better price for their butter than the old-fashioned dairy butter could command that private dairymen have been forced to adopt it or suffer the loss of the top market.

Mrs. Jones, of Canada, revealed the secrets of successful dairying in a most sweet and persuasive way, and made an entire success of it in her own work. It was a beautiful appeal to her sisters, and stirred many women to a love for the work and a desire for improved methods, but to wish and to secure are two different things when the wisher does not hold the purse. But Mr. Curtiss spoke to men, and the men who heeded him speedily adopted the new method and the apparatus suited to the work. A man may put off the wife when she calls for machinery, but when he wants a machine himself he gets it.

Herein lies the advantage of the granular method over the old method of churning to a mass. The mass holds locked up in it a lot of buttermilk and casein which causes decay and rankness. But if the churning is stopped while the butter is in small granules and is then thoroughly washed with pure water of the right temperature the surplus casein and buttermilk is washed out and the butter has a fine aromatic, rosy flavor, provided, of course, the cream was clean, properly ripened, churned and worked at the right temperature.

By "right temperature" is meant that temperature which brings the butter in granules so firm that they will resist a mild pressure, but will mass in a waxy consistency under the pressure of the fingers.

The tactile sense—the sense of touch—needs to be cultivated, but it is wrong to handle butter with the hand except to test it by touch, to learn its consistency. If it is found to be a little too soft, firm it by the use of a wash water cold enough to be hard and unyielding, temper with wash water warm enough to make it waxy. The learner will do well to wash the granular butter in two waters. After he becomes tolerably expert he can do it with one washing.

As to the kind of churn, use a box churn, a barrel churn or a swing churn—not the old dash churn, nor any "ten minute churn," nor any kind which has "inside fixings" for churning. Churning should be done by concussion, not by grinding or stirring. And the churn must be large enough so that the fall of the cream will make the concussion sufficient. Also it is necessary that the churn be not more than about one-third full, or the fall of the cream will be diminished, and the churning will be delayed and wasteful of unchurned butter fat left in the buttermilk. The mistake in selecting a churn is almost invariably in getting one too small, rarely, if ever, one too large.

Before churning is commenced a little commercial butter color should be added to the cream except when the cows are eating grass. Of course for home use the color may be omitted, but the market demand is for the color natural to grass butter the year round—the natural June color—but do not overcolor, as it gives it a repulsive appearance.

If not more than ten to fifteen lbs. are made at once the salt can be added to the granular butter in the churn, the churn slowly revolved to incorporate the salt with the butter, then press the butter down firmly with a pestle or potato masher, pile it in a heap with a butter ladle and repeat the pressing down until the salt is dissolved and the surplus brine is worked out. If the churning is large—from fifteen to sixteen pounds—the salt may be added as before and incorporated by slow revolution of the churn, then the butter taken out and finished on a butter worker. With a combined churn and worker, follow the directions accompanying the machine and finish the butter in the churn.

Cream from a separator can be churned at a lower temperature than cream from hand skimming, as it contains less fibrin and will not foam so readily. It is therefore easier to make good butter with separator cream. One precaution—do not overchurn nor overwork. It spoils the body or grain of the butter. Nearly all women do both—it is the old way. If packed in a jar or tub, fill it full and press down solid, leaving no air spaces and cut off the top with a straight edge—do not rub or scrape it off—then cover with cloth and sprinkle salt over the cloth. Use good dairy salt, not stock salt or ordinary barrel salt. It is impure and unfit for the purpose.

Here are the main cautions to bear in mind:

Do not hold the cream too long.

Do not churn too long.

Do not rub the butter nor handle it with the hands.

Do not overwork the butter.

Do not use poor salt.

The right temperature for churning and working depends somewhat upon the individuality of the cow—more upon the feed and the length of time since they were fresh. Cottonseed by-products used as a feed make the butter hard in texture, and a warmer temperature is necessary to make the butter pliant. Oil meal makes a soft butter and the cream must be churned at a low temperature. Bran makes cream churn easy and makes waxy butter if the temperature is right. Grass milk makes churning easy, and calls for a low temperature for best results. As a rule, except in winter, the butter needs firming after it is in granular form, and cold water will do this. One thing the novice needs to learn in the beginning—to stop each part of the work in time. Overdoing is the usual mistake.—E. C. Bennett, Bremer County, Iowa.

HOG CHOLERA VACCINE.

Editor Cultivator: Please tell me if there is any vaccine for hogs to remedy cholera.—E. B. B., San Diego.

We do not know of any reliable vaccine for hogs. Write the Department of Animal Industry, Washington, D. C., for information.

Veterinary Instruments, Black Leg and Anthrax Cure. See O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

24 YEARS WEAR NO REPAIRS **SEPARATOR FACTS** **43 YEARS WEAR 75¢ REPAIRS**

Just facts—that's all you want. Facts can't hurt you nor Tubular Cream Separators. Facts prove Tubulars outwear all other makes five to ten times over.

On August 2d, 1904, we started a No. 9 hand driven Dairy Tubular, rated capacity 900 lbs. per hour, on the hardest test a separator was ever put to—an endurance test to last until the wearing parts give way. This Tubular has now run 50 hours a week for 43 weeks—and is still running. Every week of this test is equal to a year's service in a ten cow dairy. No other separator made could stand such a test.

24 Years' Work—No Repairs

Hours run	1,200
Pounds separated	1,080,000
Turns of crank	3,155,760
Turns of bowl	1,152,000,000
Oil used	8 quarts
Time oiling	About 4 min.
Time adjusting	None
Repairs	None

43 Years' Work—75c Repairs

Hours run	2,150
Pounds separated	1,935,000
Turns of crank	5,652,070
Turns of bowl	1,864,000,000
Oil used	5⅜ quarts
Time oiling	About 7 min.
Time adjusting	10 min.
Repairs	75 cents

After 24 weeks, the balls in the frictionless bearing supporting the bowl showed wear. This was natural, for each had rolled over 32,000 miles. Renewing balls cost only 75 cents and ten minutes adjusting, yet made this Tubular as good as new. All Tubulars are equally durable. Catalogue P-260 tells about them. Write for it today.

THE SHARPLES SEPARATOR CO.

There are more of the **Sharples Tubular Cream Separators** in use in California than all other makes combined. Write at once to the State Agents for Catalog R. Address **Joshua Hendy Machine Works**, Separator Dept., 61-77 Fremont St., San Francisco, Cal.

Profit in the Poultry Yard

BY MRS. A. BASLEY, HOLLYWOOD, CAL.

TRAP NEST IMPROVEMENT.

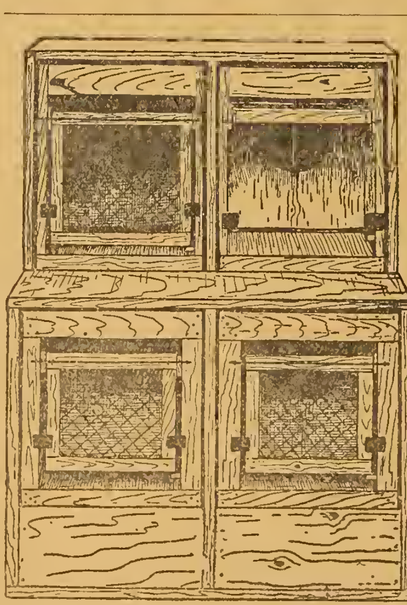
In response to many requests for plans and descriptions of trap nests from some of our many new subscribers. the following cuts and descriptions from the government Experiment Station in Maine are given and to the old subscribers I will say you can skip this page and feel glad you rarely have any repetitions in our talks on the topic of success with poultry in the Cultivator.

The reason I have headed this with "Trap Nest Improvements" is not that I mean improvement in the trap nests themselves, for I doubt if there is a better one made than this. but I want to talk a little about the improvements that comes to a flock on which trap nests are used. It would amaze a good many poultry men, if they should keep a trap nest record of their hens to discover how many of them do not pay their way. whilst it might delight them to find how well some of their hens were laying and how many eggs they were producing in a year.

To discover these things is well worth while, but heretofore poultrymen have been slow to take up trap nests, because of a belief that the time taken in attending them would make it costly. This is a mistake. as has been shown by M. K. Boyer and many other careful operators. I have used the nests and studied the question for years and I am ready to -- that the results are so great and so valuable that the time expended should not be considered. I wish I could say something that would impress on our readers the importance of knowing just what their hens, as individuals, are doing for them. It is a nice thing to have a flock which averages well in egg production but it would be far better to have one is which each individual hen is a grand producer.

When I was in the poultry business by selecting eggs from the best layers, I had soon 200-egg layers in all my pens, in fact I will confess that amongst them I had some that layed two eggs a day. Now this is more than I would demand from any hen. One egg a day every day in the year is enough.

When I left the business to take care of my little granddaughter. my good friend. Mrs. Rhoda E. Durfee, of Santa Ana (see her advertisement) continued the business with my stock on the same lines. She recently sold some pullets to Mrs. S. A. Pease, wife of the Horticultural Commissioner of San Bernardino and when I was up there last week, Mrs. Pease showed me the pullet which had twice laid two eggs in one day, she said she would have never discovered it but for the trap nest. Both of these ladies make their own trap nests from the description given below. There are a number of poultry raisers in Southern California that are now using trap nests and so improving their flocks. Mr. Howe. manager of the W. W. Howard ranch tells me that they use the trap doors which Mrs. Howard invented each and every day of the year and by this means have so improved the size of the hens and of the eggs that they have now Leghorn hens weighing as much as a Plymouth Rock and eggs that weigh over three ounces or five eggs weighing a fraction of an ounce less than a pound. In that flock there are also ten pullets that have frequently laid two eggs a day and one pullet that on the ninth of February laid three eggs following on the tenth and eleventh with an egg each day, five eggs in three days. This would [illegible] een discovered but for the use of trap nests.



I have bought and tried and also made several kinds of nests and I find this one the easiest to make and the most satisfactory of any. There is no patent on it, for it was made at the government experiment station in Maine. Mrs. Pease and I made them ourselves from these plans without any trouble. fitting up cracker boxes with the trap door, but in case anyone does not understand the scheme, two of the poultry supply houses in Los Angeles (H. Albers Co., and S. H. Church) have made

Prussian Lice Killer

Easy, quick and certain riddance of vermin on poultry and animals.

"I have used the Prussian Lice Killer on my chickens and it is certainly the best I ever used. It is easily applied and it does its work in great shape. I will say to my fellow poultry keepers that they will save time and trouble by using Prussian Lice Killer.
Harry Rutledge, Dyer, Ind.

½ Gallon 50c. 1 Gallon $1.00.

Prussian Lice Powder

The dust method. Sure death to lice, no injury to birds or animals.

"I used a 25c package of the Prussian Lice Powder on 16 head of lousy cattle, and the day after could not find a louse. I consider it the best thing I ever saw." H. V. Spafford, Kelso, N.D.

In 25c and 50c Packages.

Prussian Poultry Food

Guaranteed to produce healthy fowls, more rapid growth, make better layers and to ward off and cure Roup, Gapes, Cholera, etc.

"We have used Prussian Poultry Food for more than two years with great success. We find that it is the proper food for young chicks and just the thing to keep up laying hens."
Arnold Jungman, Poultry Yds, Gladstone, Minn.

In 25c and 50c Pkgs. 25 lb. Pail, $3.50.

Used by all the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hap-hazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the **GOLD MEDAL** at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A FILCHER, Commissioner.

And Now Comes New Reward for Merit:

Read the following telegram received from the Lewis & Clark Exposition at Portland:

"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

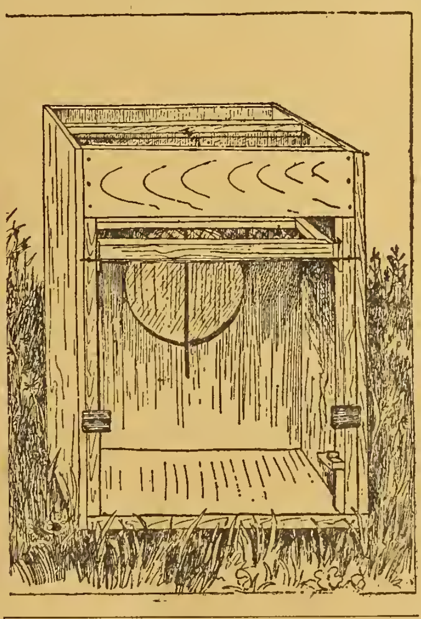
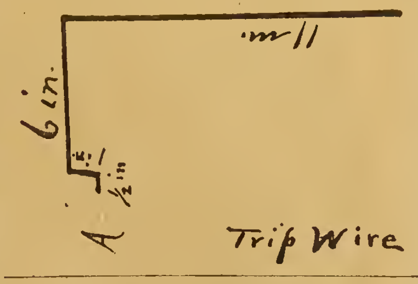
some and any one can see them or buy one as a model.

The W. W. Howard Co., have also a trap door which can be placed at the entrance of any box nest, and which I can recommend highly having tried it myself. It is patented.

There are a number of trap nest plans and also trap nests on the market ranging in price from one dollar to twenty-five. I have bought and tried several and find that the most satisfactory trap nest is one that has two compartments and opens in the front to take the hen off. In other words it must be comfortable for the hen and for the attendant.

The nest box here described was made by G. M. Gowell, agriculturist of the Maine Experiment Station, after a careful study of the various nest boxes on the market. and is intended to combine their excellences and avoid their defects. I can assure you that this plan which costs you nothing is far superior to most of those that are highly advertised and which cost at the cheapest one dollar for the plans.





This is the box that is illustrated here and the description is in Mr. Gowell's own words: "The nest box is very simple, inexpensive, easy to attend and certain in its action. It is a box-like structure without one end; and is twenty-eight inches long, thirteen inches wide. and thirteen inches deep—inside measurements. A division board with a circular opening seven and one-half inches in diameter is placed across the box twelve inches from the back. The back end is the nest proper. Instead of a close door at the entrance, a light frame of inch by inch-and-a-half stuff is covered with wire netting of one inch mesh. The door is ten and one-half inches wide and ten inches high and does not fill the entire entrance. a space of two and one-half inches being left at the bottom and one and one-half inches at the top, with a good margin at the sides to avoid friction. If it filled the entire space it would be clumsy in its action. It is hinged at the top and opens into the box. The hinges are placed on the front of the door rather than at the back or center, the better to secure complete closing action. The 'trip' consists of one piece of wire about three-sixteenths of an inch in diameter and eighteen and one-half inches long, bent as shown in drawing. A piece of board six inches wide and just long enough to reach across the box inside is nailed flatwise in front of the partition and one inch below the top of the box, a space

SHADE'S Rhode Island . . . Red Farm

Automatic Chicken Feeders.
Shade's Egg Food sold to consumers only.
San Bernardino, - - California.

Raise Every Chick

If every Chick hatched last season had reached maturity in 60 to 90 days—hardy, strong and vigorous—how much extra money would you NOW have in the bank?

You could have SAVED these Chicks—every one—if you had used

Purina Poultry Feeds

—for one kind—Purina Chick Feed, is made on purpose to save the lives of little Chicks, and make them grow like weeds. And it DOES IT. Brings up the highest percentage of every hatch EVERY TIME.

The other Purina Feeds MAKE EGGS—make your hens lay all the year 'round—make zero weather eggs EASY. They do this EVERY TIME, and with EVERY HEN, too.

These may sound like "broad statements."

But don't take OUR WORD for it—try it—prove Purina Feeds yourself by feeding them to YOUR hens or chicks at OUR EXPENSE. If the RESULTS don't come, just tie up the bag and write us, and we will return every penny of your money, and tell you what to do with the unused feed. You are not out a cent in making the trial, for we will supply you through your dealer or direct, FREIGHT PAID, and the feed used in testing will cost you nothing.

This is the Money Back line

of one-fourth of an inch being left between the edge of the board and the partition. The purpose of this board is only to support the trip wire in place. The six-inch section of the trip wire is placed across the board and the wire slipped through the quarter inch slot and passed down and close to and in front of the center of the seven and one-half inch circular opening. Small wire staples are driven nearly down over the six-inch section of the wire into the board, so as to hold it in place and yet let it roll sidewise easily. When the door is set the half-inch section of the wire marked "A" comes under a hard wood peg or tack with a large round head, which is driven into the lower edge of the door frame. The hen passes in through the circular opening and in doing so presses the wire to one side and the trip slips from its connection with the door. The door promptly swings down and fastens itself in place by its lower edge striking the light end of a wooden latch or lever, pressing it down and slipping over it. The latch acts quickly enough to catch the door before it rebounds. The double box with nest in the rear end is necessary as when a bird has laid and desires to leave the nest, she steps to the front and remains there until released.

With one section only she would be very likely to crush her egg by standing upon it.

The boxes, which have no tops. are arranged in cases in groups of four and slide in and out like drawers (see fig. 4). They may, of course, be used singly, by simply providing a cover for each box. When a hen has laid, the nest is pulled part way out or the cover lifted. as the case may be. and the hen removed.

I have made nest boxes myself from these plans. I used wooden shoe boxes or cracker boxes and easily made two in a morning. The wire was a little difficult to bend, but a boy did it for me. One word of caution: It is well to have nests enough, because the hens must be coaxed to lay and when they get ready must not be kept waiting. If a hen is dissatisfied with her nest she may hold her egg for twenty-four hours and in time be taught to lay only every other day. It is wise to encourage the hens to lay and I have found these trap nests so cleverly invented by Mr. Gowell are much liked by the hens while others I bought and paid a big sum for, frightened the hens and prevented their laying. They were enclosed on the nest pushing their heads out and trampling on the eggs, breaking some and entirely defeating the object of the nest which is, "more eggs and better hens."

* * *

EDITOR'S QUESTION BOX.

Water Glass. (W. H. S., Toluca.) Will you kindly through the medium of the Cultivator, give me the following information?

Will eggs that have been stored in a solution of water glass keep for any length of time after being removed from the solution?

To prepare eggs for the market what has to be done to them after removal from the solution?

What is the best receptacle for keeping the solution? At present I use only earthenware jars. Can wooden casks be used safely, and coal-oil cans if carefully cleaned? Has water glass any action on metal?

Answer. From personal experience I know they have kept well for ten

West Coast Chick Feed
A perfectly balanced ration for the growing chicks. All pure food, no filler, no waste, hence cheapest. Keeps them growing and healthy. Made by
WEST COAST STOCK FOOD CO.
818 San Fernando St. (through to Alameda) Los Angeles, Cal.

SAM'L R. KELLAM, President of the L. A. Co. Poultry Association, says: "West Coast Chick Feed is the best feed for young chicks I have ever used."

MRS. A. BASLEY, the celebrated poultry authority says: "I want some more of your West Coast Chick Feed for it is excellent. It is purer, cleaner and appears better balanced than other feed I have been using, and to tell you the truth I have been experimenting feeeding both together and they always eat yours in preference."

S. M. BUTLER, Lamanda Park, the well known poultry judge and successful breeder, says: "I want to say that too much praise can't be given West Coast Chick Feed for growing Chicks."

Price of Eggs—$1.50 per 15, $5 per 100. ***Send for Illustrated Catalogue. Address,***
LEO. W. MARDEN, Manager

days; how much longer they would have kept I cannot say.

Rinse them in cold, clean water. You can also wipe them dry.

The government reports advise earthenware jars. The eggs can also be kept in the silicate solution in wooden kegs after thoroughly cleaning and scalding the keg. Tin cans are not so good for they turn rusty and the solution becomes dark like iron water; this might color the eggs. The first eggs I kept were in oil cans, but I did not like the rusty appearance. The eggs kept well for nine months when we finished eating them.

* * *

Blue Andalusians. (L. S., Pomona.) Can you tell me what the markings of the pure bred Blue Andalusians are? Why do the eggs from an all blue hen hatch out a white chick or one with blue and red feathers mixed? Are they pure bred when they hatch out off-colored chicks. Please give me information on this point.

Answer. The plumage of these beautiful fowls is a light, slaty blue, laced with a darker shade of the blue, which should stand out cleary and sharply, the desired contrast being pronounced and well defined. This breed has the unique distinction of wearing the national colors, the red white and blue, having red comb, wattles and face, with white earlobes and blue plumage. The origin of the breed is not known, but it is supposed to have originated in a cross between the black and white Minorcas, whom it greatly resembles in shape and general characteristics. The chicks when first hatched out are often of divers colors, but usually when they get their full plumage are blue, although occasionally one will take back to the original ancestor and be black, white or partly colored.

* * *

Hen Houses. (L. P. L., Pasadena) From studying the Cultivator regarding the care of fowls, I find that to succeed in having healthy chickens largely depends upon their night quarters. but I have seen nothing as to how to build the houses, as to ventilation, space given. and how constructed. I should be glad (and perhaps might) to see something on this subject.

I want to build a house to hold thirty chickens. Can you give me a plan for a cheap house?

Answer: In planning a house for fowls in this climate we must remember that what fowls require most is fresh air. without any draughts.

To secure this the house must either be entirely open on one side or open at the bottom from six to ten inches all the way round.

To make a house open at one side or a "fresh air" house, as well call it. is very simple; I saw some very satisfactory houses at O. S. Hoffman's at San Jacinto; they were made something like the accompanying plan. At the bottom on all sides for two feet deep they were boarded, this was to keep in the straw. Above these two boards were panels of ruberoid which fitted into two slots (or buttons) at the edge of the boards and were held in place by two buttons at the roof. These panels were taken down every sunny day to air and sun the house. The lowest side. or it might be called the back of the house is open at night and day, except when the rain is beating in, when a burlap curtain is lowered. The dropping boards are four feet wide. the perches placed six inches above them. The whole floor is used as a scratching pen. This is one of the cheapest and best houses I have seen.

The "mushroom" house is also very good; it is a small house that stands up on four legs from six to ten inches above the ground. You can make a frame of almost any shape or size and cover it either with shakes, ruberoid, canvas, burlap or even with domestic muslin, oiled and make a fairly good house. I have used both these myself and prefer the first house. Mine are made of matched lumber instead of ruberoid.

Mr. Hoffman has used the ruberoid for two years and likes it.

The house nine feet by fifteen is divided in the middle by chicken wire so as to form two houses. You will find it better to divide your thirty hens into two colonies.

* * *

Turkeys. (Mrs. D. J., Sespe.) I set incubator with 86 turkey eggs. tested out three and run incubator like for hens' eggs. Only hatched 33 poults, and part were weak and some crippled; now can you tell me what was the matter? Other eggs laid at the same time, set under turkey hens hatched well and little ones all stout and healthy. I saved thirteen in brooder until two weeks old, when they died. What was the matter?

Answer. I am very sorry for your disappointment about your turkeys. It is such a grief to have a poor hatch when one has been counting on a lot of turkeys. It would be almost impossible for me to tell you why your incubator did not hatch. I have a letter from another lady, who says: "By your advice given three years ago, I got a small Cyphers incubator and find it will hatch every fertile egg." I therefore conclude the fault must be in the incubator, especially as you say the eggs under hens hatch well. The usual reason for cripples among chickens is irregularity of heat in the incubator, or too great heat the last week. You do not even give me the name of the incubator.

The little ones that you let run by the ditch evidently were very hungry for green food and either over ate of it or partook of some weed that disagreed with them, and may also have wet their feet or the sudden change to perfect liberty and the change in food all combined had a fatal result. You cannot be too careful about sudden changes in food or management with turkeys.

SMALL CHICKEN COOPS.

L. P. L., Pasadena, will give you an answer and plan of small chicken coop next week.

* * *

IT'S DANGEROUS.

Editor Cultivator: Is corrosive sublimate a safe thing to use as a lice killer in chicken cooks?—Mrs. G. C., Modesto.

Answer: Corrosive sublimate is a very virulent poison and dangerous to have around. Lee's Lice Killer will reach the same results, though slower in action, of course, but not so dangerous to handle.

S. C. WHITE LEGHORNS
I can furnish you with first-class eggs that will hatch strong, vigorous chicks, and give you satisfaction. $2.00 per 15, or $7.00 per hundred. Stock for sale. All eggs and stock purchased of me shall give perfect satisfaction. I make this a point.

MISCELLANEOUS NEWS NOTES

The Central California Press Association held a largely attended meeting at Hanford last week.

The Pasadena board of education has issued an order abolishing all fraternal societies in the schools of that city.

At the last municipal elections in Southern California held last week nearly all incorporated towns voted no license.

The Library Board at Covina is to lay out the library grounds on an improved plan and decorate the same with trees, plants and shrubs.

The Ledger says a steel plant costing $5.000,000, which will give employment to 5.000 men, will be built at Tacoma the present season.

The city of Lemoore. in Tulare County, is going to oil its streets, and has made a contract for the work to be done for $1.10 per linear foot.

The Board of Supervisors of Tulare County has ordered the sum of $10 to be paid for the conviction of any party who mistreats children or animals.

J. B. Lankershim of Los Angeles has placed a contract for three and one-half miles of gum trees along his property line from the top of Cahuenga Pass to Leiberts Canyon.

Highway contractors in Santa Cruz County are experiencing great activity at the present time and permanent road building is to be the county slogan for the future. Good.

The Santa Cruz Board of Trade has been working to keep the fishing streams of the county, which are being held as private preserves, free to all nimrods.

The Visalia Delta says that the marble of which a twenty-two story building is to be erected in San Francisco will come from a quarry at Three Rivers, not far from that town.

Through the efforts of the club, the supervisors of San Diego County have voted $2000 for repairing the Coast road. Work will begin as soon as possible, and carried up to Oceanside at once. Beyond there it will be pushed to the Orange County line as fast as the funds become available. Orange County will try to have a good road all the way down the coast to San Diego.

A PRESS OF MERIT.

The manufacturers of the New Century Hay Press evidently believe they have the best press on the market. If they were not certain, it is not likely that they would make the liberal offer to prospective buyers that they do. Their offer is to pay the railroad fare of any hay press seeker who comes to Los Angeles and buys any kind of a press on sale here, provided they are given a chance to show their press. This is a bona fide offer with no strings to it. They believe they have the best press on the market and are willing to take the chances of demonstrating to any prospective hay press buyer that their claim is true.

The New Century Press is now in its fifth year and has passed the experimental stage. It has the largest sale of any press on the Pacific Coast where the grass is long and hard to bale, thus proving that it is as its makers claim, the strongest press on the market.

Owing to the great pressure necessary to make neat bales and to make the baling of hay profitable, the power mechanism of a hay press is one of its principal features. In the majority of presses it is necessary to have a strong, clumsy, heavy pitman. the head block being pushed into the baling chamber. On the New Century a one-inch steel rod takes the place of a pitman and the power is applied to the block head by a pulling instead of a pushing. This rod has a tensile strength of 35,000 pounds. The catalogue, which the manufacturers of the New Century will send to any person desiring one, will explain and illustrate the merits of this plan more fully. A large stock of New Century Presses are kept at Los Angeles, but all correspondence concerning the press, should be addressed to the WESTERN STEEL & WIRE CO.. Kansas City, Kansas.

The Pomona Progress says the city trustees are discussing the necessity of oiling and caring for oiled streets in that city, and a "smoother" has been purchased to be kept running on the newly oiled streets.

A herd of 100 2-year-old elk to be distributed in the forest reserves of the San Bernardino, San Gabdiel and San Jacinto mountains the coming fall by the government is the statement given out by Forest Supervisor T. P. Lukens of Pasadena in an interview at Redlands.

A company of business men of Delano have purchased the Tyler warehouse in that town and have built another warehouse of equal size in anticipation of the big wool crop this year in that section.

An oyster shell nine inches long eight inches wide and three inches thick perfectly preserved was unearthed near Ukiah last week. The Times says: The place where it was found is 1900 feet above sea level and it was imbedded in sand stone. According to geological chronology it is at least 10,000 years old.

THE WAY TO GET READY FOR HARVEST

If you grow grain or grass of any kind, you are invited to call on any dealer who sells one of the *International Line of Harvesting and Haying Machines* and get one of the new 1906 catalogs. You will find it well worth your while, for it's full of good grain sense—harvesting talk that means *bigger profits* for you.

While you are there, take a few minutes and look at one of the harvesting machines itself.

You will find that it comes up in every way to what your ideal of a *good* harvesting machine ought to be.

It is *convenient*—easy on you and easy on your horses—because it embodies every labor-saving, draft-reducing device that the most expert mechanical skill of the past 50 years has produced.

It has *large capacity*. There is no wasted energy about it. It allows you to do the work of harvesting "in a hurry."

It is *dependable* because it is made right. The materials used in it—the steel, iron and lumber—are the products of the manufacturer's own mines and mills and are right in every particular. There is no "guess work" about them. They are tested before used.

It is an *economical* machine because it saves all your grain; it saves time; it saves labor; it saves repair bills; it saves worry and trouble.

If a machine is *right* in its design, *right* in the materials used in its construction, *right* in its workmanship—it comes pretty nearly meeting every requirement you can make of it.

Convenient—trustworthy—economical. What more can you ask of a harvesting machine?

* * *

This question of harvesting means much to you. A half day's delay may make the difference between profit and loss on your crop.

The grain a poor machine or a worn-out machine *wastes*, is just so much from your profit.

It's too late now to reduce the *cost* of growing the crop—too late to *increase* the yield—your only chance is to get it *all* in the harvesting and to get it at the least expense of time and money.

If you grow grain, you need a *good* harvester.

If you grow hay, you need good haying machines.

It is economy to get the *best* you can find.

International dealers have them.

Champion Milwaukee
Deering Osborne
McCormick Plano

Go to the dealer and see for yourself.

If you don't know him, write to us for his name and address.

International Harvester Company of America, Chicago
(Incorporated)
WESTERN GENERAL AGENCIES: Denver, Colo., Portland, Ore., Salt Lake City, Utah, Helena, Mont., Spokane, Wash., San Francisco, Cal.

INTERNATIONAL LINE.

Binders, Reapers, Headers, Header-Binders, Corn-Binders, Corn-Shockers, Corn-Pickers, Huskers and Shredders, Corn Shellers, Mowers, Hay Tedders, Hay Rakes, Sweep Rakes, Hay Loaders, Hay Stackers, Hay Balers, Knife Grinders, Gasoline Engines, Pumping Jacks, Manure Spreaders, Weber Wagons, Columbus Wagons, Bettendorf Wagons and Binder Twine.

Remember:

There's a good old proverb about the impossibility of making a silk purse from a sow's ear.

It is equally impossible to make a good machine from *poor* materials—or unsuitable materials.

And likewise impossible to make a good machine even from *good* materials, without proper skill and proper facilities.

Every farmer knows how much harder it is today to get good lumber than it was 20 years ago.

Every manufacturer knows how difficult it is to get other materials of exactly the right kind at exactly the right time.

It was to overcome these difficulties that the several manufacturers of the various machines comprising the International Line, co-operated with each other in producing their own raw materials.

They cut and saw their own lumber, in their own forests; they dry it in their own kilns, and they have it ready when they need it.

They mine their own iron and coal; they make their own coke and steel, and they produce much of the other materials used in their factories.

The result is that they do not have to try "to make a silk purse from a sows's ear." They have the *proper materials* at hand, when they need them.

Nor is that all. The International Line of machines for harvesting and haying embraces *only* machines which have stood the test of time and bear the stamp of approval of the American farmer.

Consequently there is always a good demand for them, and this demand makes possible the employment, in their manufacture, of the most expert workmen and the best facilities that the mechanical genius of the world has produced.

It is these things that make the International machines so satisfactory to the user.

Queries and Replies

FERN TROUBLES.

Editor Cultivator:—Will you please inform me through your paper what causes the new leaves of a sword or Boston fern to curl? They seldom grow more than a few inches high and are always deformed; also what causes the soil to form a greenish moss all over the top of pots? Is it too much water, the use of cow manure, bad soil or the lack of something? The plants do not grow as fast as they should; possibly it is this that dwarfs the ferns. Is the iron rust from tin cans injurious to plants? I have quite a little green house and have been anxious for some itme to hear from good authority on the above.—F. A., Healdsburg.

It is evident from the presence of green moss that pot drainage is not good with your ferns. No doubt the soil has become sour, for the plant being in an unhealthy condition, does not take up much of either food or drink. Correct the drainage, allow soil to get pretty dry and give a good soaking with lime water so that it will leach through. Iron rust from tin cans is seldom injurious to plants, especially the rank-growing ones.

STRAWBERRY TROUBLE.

Editor Cultivator: Will you please tell me what ails the strawberry plants I send you. I have many affected in this manner.—O. C. H., Los Angeles.

These plants were sent to Prof. R. E. Smith, of the State University who replies as follows:

"Regarding specimens of strawberry received from you recently, would say that they are covered with the growth of a plant organism of very low order, not exactly a fungus, but what it called a Myxomycete. This group stands at the very bottom of the vegetable kingdom, being also known as the Slime Moulds.

The form occuring on the strawberry is probably not at all parasitic, but grows on any moist surface during wet weather. It will not actually attack the strawberry plant nor cause any serious trouble. With dry weather the growth will disappear. Some fruit may have been moulded during wet conditions, but the grower may feel sure that this is not a serious matter or in any sense a condition which is likely to continue."

KEEPING TABLE GRAPES.

Editor Cultivator:—Please tell us the simplest way of keeping table grapes through the winter for table use?—J. B. M., Imperial.

Mrs. Sherman of Fresno answers the above as follows: Cut off a good piece of cane, say four or five inches on each side of bunch and hang it up in a cool dry place. Sometimes we have grapes until March. The French have a way of sealing one end of the cut cane with sealing wax and putting the other end into a bottle of water.

LEAF EATER.

Editor Cultivator: I find on my vines a black bug, something smaller than a lady bug; they are eating the leaves and new shoots; can you tell me how to get rid of them.—A. R. C., El Centro.

The treatment usually is as follows, in a large vineyard. the dust method is cheapest. Often these infrequent pests are merely let alone, and next season the borders or weedy growths that harbor the eggs and grubs are cleaned and burned off.

Remedies: 10 pounds of sulphur; 1 pound of buhach; blow on the foliage with bellows, or use Paris green, 1 pound to 10 pounds of flour; apply either of these when the leaves are damp. If very dry spray the foliage with cold water or else sprinkle with a whist broom over the leaves. A spray of whale oil is also good, one-third of a pound of sulphur is boiled ten minutes in a gallon of water, to this add a pound of whale oil soap and one ounce of lye or soft soap. Boil five minutes more, then reduce with two gallons of hot water, apply with a fine spray nozzle while warm.

GLOBE ROSE.

Editor Cultivator: I mail you today in separate package a slip from a shrub growing in my garden, and would be much obliged to you if you can give me through the Cultivator the proper name for it. It is sometimes called the "Yellow Rose." but that name is somewhat of a misfit for it.—Inquirer, Santa Ynez.

Your shrub is Kerria Japonica, belonging to the rose family (Rosaceal) and known as "Globe Flower" or "Japanese Rose."

TESTING MILK.

Editor Cultivator: Please tell me what other way there is of testing milk besides the Babcock that can be depended on.—J. P. C., Modesto.

We know of no other tester as reliable as the Babcock, although we have heard that in Ohio a new tester has been made. It is as yet untried, we believe.

Every farmer needs a water tank and should have the best to be obtained. A galvanized steel tank costs but little more than the wooden tanks and certainly lasts enough longer to make it the cheapest in the end. No leaks and no driving down the hoops after a few days of warm weather. It is cleaner and far better than wood in every respect. The J. F. Holbrook Co., 310 S. Market st., Los Angeles, are making the only corrugated galvanized steel tank made in California and they will be pleased to mail catalogue. description and prices. Shipped to any point on the Coast.

Driver, Aber & Co., San Leandro, Cal., manufacturers of "The Boss Ladder," ship them all over the state, freight prepaid. Their advertisement appears in this issue of the Cultivator.

"THE BEST LIGHT ON EARTH."

This statement excepts sunlight, of course, but from all we are hearing the Superior Acetylene Generators are producing results (which should be most gratifying to the manufacturer as well as assuring to customers. We are pleased to call attention to the Superior Light and Heat Co., whose ad. apears on page 347 of this paper.

A SLOW RAILROAD.

The Nevada and California Railroad wanders about a bit in the mountains and its trains go at a leisurely rate. says the New York Tribune. A mining man who travels the road much tells of the illuminating incident regarding an Eastern visitor on the train. "He called the conductor," relates the miner, "while he was passing down into the aisle, and said:

"Conductor, how far it it to Hawthorne?"

"Fifty miles," said the conductor.

"Only fifty?" repeated the passenger. You been on this road very long?"

"Twenty-five years," said the conductor.

"Is that so?" said the passenger. "Is this your second trip?"

"Then the conductor wanted to fight.

APPEARANCES DECEPTIVE.

In the town of Newbury there lived a man named Nathan Hoobs, who sometimes drank more than was good for him. One cold moonlight night two deacons were walking home from prayer meeting. Hoobs was just ahead and heard them coming. In a minute he was down at the roadside where he lay like a log.

The deacons rolled and shook him, but he didn't move.

"Well." said Deacon Smith. "what are we going to do? We can't let him lie here and freeze, and we can't carry him home; that wouldn't do."

"I'll tell ye," said Deacon Moare, "we'll take him up to Mr. Flint's barn."

So one took his feet and the other his shoulders, and they began their up-hill walk, wheezing and puffing away. Twice they laid him down and nearly concluded to let him lie there, but finally they reached the barn. They tugged him up into the haymow and let him down.

"There," said Moare, "I believe we have done our duty. Certainly he won't freeze, an' I dunno but it's going to take a week to sober him up." And the deacons started for home again.

"Hold on. gentlemen," shouted a voice. They turned. and there in the moonlight they saw Mr. Hoobs walking with rapid strides toward them.

"I want to thank you gentlemen for your kindness." he said, "and if you don't mind I'll walk along with you."

The deacons became suddenly mute. and the silence seemed to be getting so painful that Mr. Hoobs decided to take a short cut for home across the fields.

MARRYING FOR MONEY.

When Mr. Jephson was thinking of marrying a girl "with money," his friend Rogers advised against it for reasons which he was quite ready to give, says the Atchison Globe.

"My boy," he said, "before I was married my wife inherited $500 from her grandfather. The whole town knew it. When I built a store, they smiled.

"His wife's money."

"After a while I took stock in the new gas and electric company.

"Aha!" said the treasurer. "I see you are investing some of your wife's money."

"All my life that poor little $500 has received the credit for every thing I have been able to achieve.

"As a matter of fact. my wife spent the money the day she got it for a diamond ring and a piano. She lost the ring a week later. and I guess some of the neighbors have wished heartily that she would lose the piano.

THE AMENDE HONORABLE.

A Washington newspaper correspondent says that Colonel Henry Watterson once told him he had always made it a rule never to make retractions. holding that the paper should assume that no mistakes were made, says Lippincott's.

In this connection. Colonel Watterson said that one day there appeared in the columns of the paper the obituary of a man tolerably well known in Louisville. The deceased appeared the next day in person. and. naturally enough, demanded a retraction. Colonel Watterson, with great sauvity, explained to the unfortunate gentleman that the paper never made mistakes and never corrected alleged errors. At this the subject of the obituary waxed exceeding wroth and demanded satisfaction..

Colonel Watterson then informed him that the only suggestion he could think of would be to place the gentleman in the birth column—as a new arrival, so to speak.

HOW A MISTAKE OCCURRED.

A. G. Hales, the war correspondent, writing in London Opinion and Today on the unequal talent to be found in the house of commons, tells a story he heard of a coxcomb who was once mistaken for Bernard Shaw. He and Mr. Shaw were once in the same Turkish bath, lying on the slabs, with towels over their faces. The attendant came along and touched the coxcomb on the shoulder. "Ready, Mr. Shaw?" he said. The coxcomb bounded to his feet, all aglow with pleasure at being mistaken for a man of intellect. After he had been rubbed down he gave the attendant half a sovereign for so full was he of the pride that goeth before a fall. As he turned to go he said. "Er—my man—er—what made you mistake me for Bernard Shaw?" The attendant grinned. "Er—well, sir. you see. sir, you 'ave the same sized feet."

A WOMAN'S CHANGE OF HEART

Editor Cultivator: In Januarv. 1902, my husband bought 20 acres of land in the Fernando Valley, seven miles from the pretty village of San Fernando. I thought it a dreadful thing to move out of the city onto a little farm away from people and things I had been used to so many years, and I had a good cry. woman like, before we moved and after we made the change. The place was really a pretty one when we took possession, it had many varieties of flowers. there were trees. the house needed painting but it was comfortable; the out-buildings were run down a bit and the road leading to town was not very good. I had not handled chickens for 20 years, except to dress them, and had no experience in raising them in California.

But it seemed to be a question of better health for my husband and our daughter and I accepted the situation cheerfully and even interestedly and went to work to do the best I could. As all my women friends know, hired girls are difficult to get and keep in the country and I found very soon that I had myself to depend on most of the time. We had a hired man, of course, and he had to be fed as well as the family. The work became very laborious the first three months, but I stuck to it and with what my twelve-year-old daughter could do we got along quite well. I bought a half dozen Plymouth Rock hens, began setting them as they wanted to nest. My husband subscribed for the Cultivator and I became interested in Mrs. Basley's poultry articles and the more I read them the greater my interest in chickens grew. Well, to shorten the story, in less than a year I had 50 chickens. I lost but six of them and I sold enough eggs in the winter of 1895 to pay all the expenses of the brood all the time I had it, besides furnishing the table with eggs. We bought two Jersey cows and made butter, the butter money my husband gave to me and I used it and the eggs to "fix up" the house. buying garden and yard plants and to tidy up the fences around the house and to beautify the surroundings.

You would not know the place today Husband "got busy" on the out-build-

ANTS You can keep them down and out with **KELLOGG'S ANT PASTE** which is now considered the best exterminator in the known world. One bottle does the work, only 25 cts, If your dealer does not keep it send 40 cents to the Manufactory 1010 E 9th St. Los Angeles and you will receive it prepaid by return express. Dealers wanted.

COLONIST RATES TO CALIFORNIA

Santa Fe

Will be in effect every day, Feb. 15 to April 7, and Sept. 15 to Oct. 31, 1906, from all points in the east and south.

Following are a few:

Chicago	$33.00	Kansas City & Leavenworth	$25.00
St. Louis	30.00	St. Joseph & Atchison	25.00
Galveston	26.45	Council Bluffs & Omaha	25.00
Dallas, Houston and Fort Worth			25.00
Nearly all points in Kansas, Oklahoma and Indian Territory			25.00

Colonist rates are also in effect from all points east of Chicago and south of the Ohio river.

Santa Fe Agents in California will take deposits of money to cover price of tickets, which will be promptly furnished to passengers at any point from which these rates are in effect.

California illustrated literature mailed free to any address or may be had from Santa Fe representatives.

Tourist Sleeping Car Lines

Colonist tickets are honored in tourist sleeping cars which run via the Santa Fe to Los Angeles and San Francisco.

ings, painted them with government whitewash; planted eucalyptus, pepper and acacia trees around the fences, and sowed down the front yard to clover, we put in plants and flower seeds wherever we could, and before we really realized what we had done our place was a literal bower of roses, geraniums, poppies and other flowers and we found we had no time to think nor disposition to care for the city or its charms. Today, with good health, and lots of pretty things around us we wonder why we staid in Los Angeles as long as we did. I would not go back to the city for the present of a home on West Adams street. The country is the place for me and mine. I can, with enthusiasm, quote the words of the country songster who wrote:

"I would from the city's rule and law,
Its fashions and forms cut loose,
And go where the strawberry grows on its straw.
And the gooseberry grows on its goose;
Where the cow on the fragrant cowslip feeds,
Where the dew on her dewlap lies,
And the dog to the waving dogwood speeds,
And the bull to the bullrush flies."

I am writing a letter of my experience—I could write much more—to show my sisters that the country has charms which the city can not give. I have experienced a change of heart and like every new convert to a cause I want to tell some one about it.—E. B. M., Fernando.

COOKING AND SERVING VEGETABLES.

"Good cooking is to make the food palatable and pleasing to the eye. To know just how long to cook the article, the exact amount of seasoning to use, and the proper way to garnish and serve it. Cooking is not the degrading occupation some people regard it, fit only for those who cannot do anything else. It is a science not difficult to comprehend, but one that requires interest, attention and judgment; a science that has claimed the devotion of wise and learned men and women. The kitchen has been called the "Laboratory of a Household," wherein are concocted all those comfortable dishes that pertain to the health of a family.

Thus, well states Mrs. James Armstrong, in the Deseret Farmer, two important facts, which enter vitally into the health and happiness of every home.

Ruskin says: "Cooking means much tasting and no wasting." How many times suitable food is provided for a family, food which would strengthen the worn-out tissues, but it is utterly spoiled in the cooking. Vegetables, as well as every other kind of food, should be cooked just long enough and no longer. Over cooking is as bad as under cooking. A good cook studies the fire she is to cook with. She makes an intelligent use of the proper utensils, does not boil vegetables in a cake pan nor attempt to fry in a roaster. A good cook does not put off until the last minute her preparations for the meals, but has everything ready to begin on time, giving each article its full and right amount of heat, neither having the stove red hot nor putting the saucepan on the coals; her food never burns, never is underdone, but is always just right, because she is careful, watchful and thinks of what she is doing.

Aside from their value as a food nearly all vegetables possess curative properties of a very high order, and will many times do more towards aiding nature in overcoming disease and toning up the system than many drugs. This is particularly the case with children whose recuperative powers are great. Housekeepers should therefore begin by serving the table daily with the first spring vegetables and continue throughout the season. Many families use meat to the exclusion of other diet, which is by no means wholesome, to say nothing of the expense. A taste for vegetables can be cultivated in children very early, and mothers of families should see that such as are liked by their children are served with daintiness and variety so as to tempt the appetite and render vegetables a necessity upon the table. The daily diet may be so varied as to have some vegetable of medicinal quality served throughout the season, so as to keep the family in good health. If called upon to decide the most important item in cooking vegetables, in order to have them palatable, I would say the proper seasoning is by far the most necessary detail of this branch. Of course, the tastes of people differ as to seasoning, but a perfect blending of the various flavors suited to each dish rarely fails to be acceptable. Good seasoning of vegetables as well as of all food consists in knowing exactly how to produce the result.

In regard to the various utensils used to cook vegetables, I prefer the granite ware. If you use salt in cooking vegetables in the irot pots you will darken them, that is such vegetables as corn, etc. A great deal is in how the vegetables are sent to the table. Never send them to the table in cold dishes. Always have the dishes perfectly clean, and if possible free from cracks or unsightly marks. It pays to take time to arrange the vegetables nicely, as what looks nice is, I think, much more appetizing.

Potatoes are said to be valuable on account of their easiness of digestion and nourishing qualities. The different ways to cook potatoes are innumerable. Old potatoes are better if let stand in very cold water for ten minutes after peeling, it makes them firm. New potatoes should always be put in boiling water to cook, and if possible do not let them stand around after peeling them.

The value of the sweet potato as an article of food has long been well known, but it was during the war between the Northern and the Southern States, when luxuries of all kinds for the table were wholly unattainable, and even necessaries were scarce, that the Southern housekeepers learned for the first time its possibilities as a vegetable. Tomatoes are very wholesome, and are one of the best liked summer vegetables, and like potatoes there are a number of ways of cooking and serving them.

Onions are possibly the most healthful vegetable which is eaten at the table. They tone the system and invigorate the digestive organs. Cauliflower is recommended for people of sedentary habits. Asparagus is a good blood purifier and is used by the French in treating rheumatism. In boiling cabbage some people make a great mistake in boiling it too long. It should have a fresh taste when cooked and not too soft and soaked with water when served. A great many say they cannot eat cabbage, it does not agree with them. I think one reason is that they cook it too long. There is no tastier vegetable if properly cooked and served. Among the early spring vegetables few are more desirable than spinach, not particularly for its excellence as an article of food, but also for its medicinal qualities. It is considered to be a purifier of the blood, is one of our best early vegetables and can be served in a variety of ways. Celery is very quieting to the nervous system and very beneficial to sufferers from neuralgia and rheumatism. The most common way is to serve the stalks cold (after they have been thoroughly washed). Lettuce is a sedative, besides being cooling to the system. It is of course best as a salad, but it may be dressed with gravy, hard boiled eggs, or fried and seasoned with salt, butter and pepper.

The proper accompaniments for different kinds of meats are as follows: Roast and tomato or mushroom sauce; roast mutton, hare, venison and various kinds of beef should be served with grated horseradish; roast pork and apple sauce; roast veal, game, red currant jelly; boiled mutton and caper sauce; boiled chicken and bread sauce; roast lamb and mint sauce; roast turkey and cranberry sauce; boiled turkey and oyster sauce; boiled fresh mackerel and gooseberry sauce; boiled shad, boiled rice and salad; roast pigeon and mushroom sauce; fresh salmon, green peas and cream sauce; roast goose and apple sauce.

MARSHMALLOW CANDY.

Editor Cultivator: Can you please send me through the columns of your paper, a recipe for marshmallows, in which gum Arabic is used.—S. R. C.

Dissolve, by heating over a slow fire, 8 ounces of gum Arabic in 3 gills water; stir and strain. Boil 1 ounce marshmallow roots in a little water for half an hour over a slow fire, add the gum solution with one-half pound of loaf or powdered sugar; let cook slowly and stir constantly until it becomes a thick paste which will roll between the fingers. Add the well beaten whites of two eggs, stir for a minute or two and pour into a pan to cool. Sheets of white paper should be placed in the bottom of the pan with the ends projecting in order to lift out the paste when it may be cut into little blocks and rolled between the fingers.

SOMETHING OF INTEREST TO COOKS.

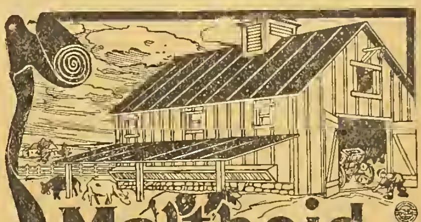
A cook-book written by a French person not knowing both countries would be in some instances almost useless. as the products of France differ very much from those of America. For instance. a French cook-book giving a recipe for cooking a sweetbread will give directions as to the time required for cooking a sweetbread taken from a French calf. But the calves being killed in France when they are three or four times older than when they are killed here. the sweetbread is naturally much larger and will require a longer time for cooking. A French cook-book will direct you to cook green peas with lettuce; and the peas being very tender will furnish enough liquid, helped by the melted lettuce, to be cooked without water. This is impossible with peas grown here, for they are picked too old and too large, and there is also something in the climate or the soil which prevents their being as tender as they are in Europe.—Woman's Home Companion.

THE ENGINE'S WHISTLE.

Are you familiar with the meaning of the railway engine's whistles? If not, the following may be interesting information: One long blast of the whistle is the signal for approaching stations, railway crossings and junctions. One short blast of the whistle is a signal to apply the brakes—stop. Two long blasts of the whistle are a signal to throw off the brakes. Three long blasts of the whistle are a signal that the train has parted. Three short blasts of the whistle when the train is standing are a signal that the train will back. Two long, followed by two short blasts of the whistle are a signal of approaching road crossings at grade. Five short blasts of the whistle are a signal to the flagman to go back and protect the rear end of the train. A succession of short blasts of the whistle is an alarm for persons or cattle on the track, and calls the attention of trainmen to danger ahead.

Good gracious! these fat men will be the ruin of me," exclaimed the automatic scales; "that last one simply put me on the bum."

"Well," replied the chewing gum machine, " now you can lie in weight for the next one."—Philadelphia Press.



Malthoid Roofing

Twenty two years of practical experience goes into every roll of roofing we make. Malthoid is a roofing you can depend upon for long-lasting durability—it will resist fire and keep out the cold, wind and dampness.

It is easier to lay than a carpet and as full directions are contained in each roll any one can apply it quickly. Send for booklet.

LOS ANGELES, CAL.

Climate and Crops

GENERAL SUMMARY.

The weather during the week was seasonable and for the most part fair and pleasant. There was a marked falling off in precipitation as compared with the preceding week and the last week in March. In some ways the week may be considered as a forerunner of summer weather. There were light showers on Tuesday and Wednesday in the central and northern portions of the State and cloudy weather in the South. During the balance of the week the skies were as a rule clear during the day hours and somewhat cloudy, especially along the coast, during the night and early morning hours. There was a fair amount of sunshine, but in no part of the State continued clear weather. A moderate storm over the Sierra Nevada and Eierra Madre on Tuesday caused strong north winds in the northern portion of the State. These lasted until Wednesday night. North winds, but much lighter, prevailed on Friday and Saturday.

The temperatures were nearly normal at all points throughout the State except on Friday afternoon, when temperatures were slightly higher than the normal. At Los Angeles a maximum temperature of 80 degrees occurred.

The absence of any marked warm spell is shown in the steady, slow fall of the rivers in both the Sacramento and San Joaquin valleys. At all points the stages are below the danger line.

STOCK FOOD COMPANY IN NEW QUARTERS.

The long-time favorite, West Coast Stock Food, is now manufactured in new quarters and with new appliances which are thoroughly up to date. The company was reorganized some months ago when Mr. T. S. Thompkins of Pasadena became associated with Mr. Wright, the former owner.

Mr. Thompkins brings large capital and with experience to the business end of the company and Mr. Wright retains the management of the working end of the establishment. In the manufacture of an honest food or of a tonic or remedy, Mr. Wright has established a reputation which is widely known.

In the mill which is now located at 818 San Fernando street, Los Angeles, a great change has been effected. The basement and two upper floors are well filled with machinery and elevators. The hauling of the raw material and of the foods is as near automatic as possible, the grains and other ingredients passing from the mill where they are ground, to the mixer, thence to sack or carton; thence to upper floors, where labels or stencils are attached.

Besides the foods the West Coast people put out "Killamite," and it will kill several—poultry tonic, which is not only a tonic for laying hens, but a cure for sick ones. Then there is West Coast Lice Killer, which fixes the lice good and plenty.

In the foods the company put out everything for poultry which will enable them to go "from shell to shelling" successfully, and with constitutions ready for hard work. These foods have a list of friends amongst the prominent poultry men and women who give them most hearty commendation.

But the best commendation is a sack of the chick food or egg food, followed by close observation of the results of feeding it.

Visit the company at the new quarters and you will see things.

The Produce Markets

Los Angeles Markets.

Los Angeles, April 19, 1906.

Prices of all necessities will doubtless be in a very unsettled state for a time, though how much the San Francisco disaster will affect local markets, time alone will tell.

The recent heavy rains have caused a marked change in the course of the San Diego River west of San Diego. Instead of emptying near the mouth of False Bay, as heretofore, the stream has cut a new channel across the Old Town flats, passing through a slough to the sea.

An invention of great benefit to irrigators has recently been patented by A. W. Applegate of Brawley. It consists of an automatic irrigating gate which opens itself, and wherever fields are irrigated from land to land will permit a large saving of work and expense to the irrigator.—Brawley News.

OPIUM and Whiskey Habits cured at home without pain. Book of particulars sent FREE. B. M. Woolley, M.D., Atlanta, Ga., 103 N. Pryor St.

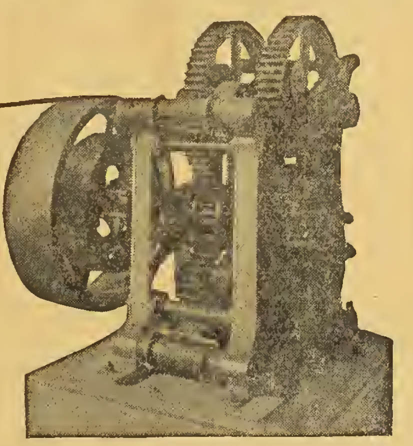
The Pomona Pump



The New Pomona Pump is now being manufactured with machine cut gears and machine cut steel or bronze pinions. The pump fitted with this kind of gearing runs as smooth as a clock and there is absolutely no noise or vibration. The company have recently taken contracts for installing their largest sized pump with this class of gearing for the Artesian Belt Water Company of San Dimas, Western Water & Power Company of Glendora and other large irrigation companies. They are required to furnish these pumps with cylinders up to 12 inches in diameter and 72 stroke which has capacity of over 60 Miner's inches of water. The valves are made entirely of phosphor bronze with ground metal taper seats so there is very little obstructiin to the water in passing through them and it is impossible to clog them with sand. These, in connection with machine cut gears, in the pump head, make a strictly high grade pumping outfit and the best by a long ways of anything on the market today.

This head and valves are both protected by United States patent. Beware of infringing as both manfacturer and user are liable.

The company has recently installed one of their latest Improved heads for the Santa Anita Land Company, a subdivison of the Baldwin Ranch. Below is what the owners have to say about it:

"The new 38 pump you installed for us on our tract on the E. J. (Lucky) Baldwin Ranch is giving us satisfaction in every way. We think we have the very best that money will buy. Both as regards to pump, material used and installation. We made an excellent change when we removed the pump we had been using and installed your make."

We have pleased these people and there is no reason why we cannot please you.

EARTHQUAKE IN WISCONSIN.

Kendalls, Wis., April 11.—By special dispatch—The following telegram tells how three separator manufacturers met an earthquake that jarred the ground under their feet:

> Kendalls, Wis., April 11th.
> The Sharples Separator Co., Chicago.
> "In the presence of forty dairymen, Tubular won big contest here yesterday over three competitors. Sold committee six sixes. Marie."

Mr. Marie is the traveling representative of the Sharples Separator Co. of West Chester, Pa., Chicago, Ill., and Toronto, Canada, manufacturers of the famous Sharples Tubular Cream Separators. The Sharples Separator Co. certainly seems to have things about their own way, easily winning all public contests in which they enter their machines. This contest certainly proved an earthquake to the three defeated competitors, as Mr. Marie's telegram says they were not only defeated, but that six of the popular number Six Tubular Cream Separators were sold on the spot as a result of this contest.

RASPBERRIES.

An exchange says:

The small fruits have a place in the garden, and with the exception of the strawberry, none is more important than the raspberry. It is needless to say that the raspberry is easily grown. Everybody knows that it is. Now that the wild berries, which were once so common, have so largely disappeared, a corner of the garden is reserved for the cultivated varieties.

The soil requirements differ somewhat with the varieties. In the main, however, the red and yellow kinds prefer a rich, moist loam, while the blacks do better in light, sandy lands, though not averse to heavy soils. But there are varieties of reds that will grow on sand, so people who have that kind of soil need not be deterred from setting them, although the ground should be enriched with a liberal amount of potash and phosphoric acid, also some nitrogen.

Most people prefer the red kinds for a dessert fruit, though the blacks have many friends. The yellow kinds are little cultivated, but they mix nicely with either of the others and make an attractive dish for the table. Purple varieties are more tart than the others, but are in favor for canning.

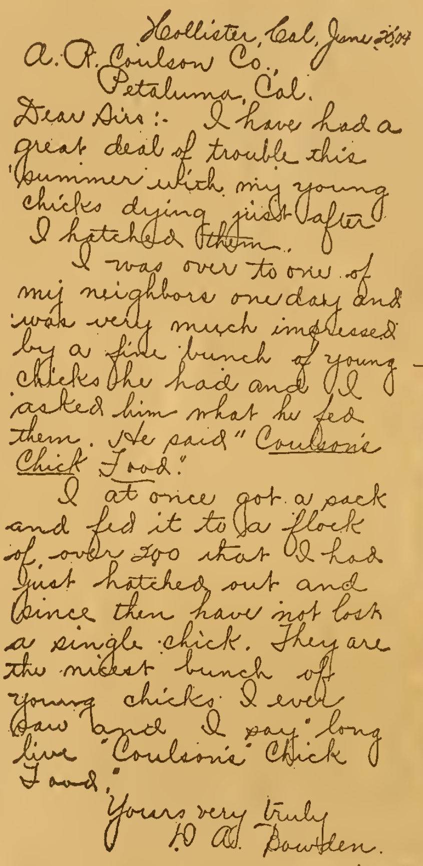
Those who intend to set raspberries will find it best to consult local growers in regard to suitable varieties, as they differ greatly in regard to fitness. A kind which is highly praised in one place may be very poor for another. The most extensively raised red variety is the Cuthbert. It succeeds over a wide range of country.

ATTENTION! FOR FRUIT-GROWERS!

Mr. F. W. Dieckmann's office on 214 California Street, San Francisco, is destroyed. All the valuable statistics of stock and dried fruits and their values in all the large cities in America and Europe are burnt. Still Mr. Dieckmann is able to give valuable information. A good many packing plants have been destroyed and his many clients in Europe and the States wish to buy fruit direct from the growers. Mr. Dieckmann has 425 buyers. It will pay you to open correspondence with him at once. His office will be until further notice at 2615 Santa Clara Ave., Alemeda, Cal.

San Diego is planning a citrus fair for next winter.

Coulson's Growing Chick Food



Hollister, Cal, June 20'04
A. R. Coulson Co.,
Petaluma, Cal.
Dear Sirs:- I have had a great deal of trouble this summer with my young chicks dying just after I hatched them.
I was over to one of my neighbors one day and was very much impressed by a fine bunch of young chicks he had and I asked him what he fed them. He said "Coulson's Chick Food."
I at once got a sack and fed it to a flock of over 200 that I had just hatched out and since then have not lost a single chick. They are the nicest bunch of young chicks I ever saw and I say long live "Coulson's" Chick Food.
Yours very truly
D. A. Bowden.

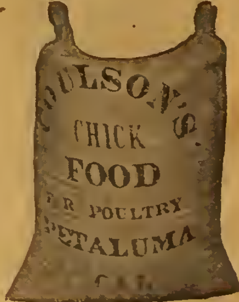
Puts your chicks ahead of all competition distanced. A complete and perfectly balanced ration for growing chicks, etc., ground grains, seeds, blood, bone and meat, etc., allcombined. It puts the flesh on them it's wonderful how it makes chicks grow.

After the chicks get to be three or four weeks old, it will be essential to give them a meal once a day of Coulson's Growing Chick Food, and when they get to be six weeks old. feed them two meals of it a day.

The Growing Chick Food is of a different combination than the baby chick food. The Growing Chick Food is ground up more like meal. It is a stronger ration. containing more Fine Meat Meal and Dried Blood, etc., so it is more of a forcing food for the growing broilers—makes the chicks heavier and plumper and makes them develop rapidly.

Mix some of the growing chick food with milk or hot water, and manipulate it thoroughly and feed in a crumbly. not sloppy, condition. Another way is to take a panful of the Chick Food and bake it over night. Then the first thing in the morning crumble it up and give it to them.

Raised on Coulson's Chick Food. Showing One of the Colonies of Pullets, 3½ months old.



Plant of Armour Packing Company [illegible] Meal is Made That is Used in Making Coulson's Chick Food.

Why You Should Use Coulson's Growing Chick Food

Common grain or chick foods, as a rule, contain too much fat-forming and not enough bone and muscle forming elements, and in consequence, the chick develops indigestion and diarrhoea, and soon dies.

If you will Feed Coulson's Growing Chick Food to the chicks they will be fully nourished, as this food is a complete properly balanced ration, all mixed, ready to feed.

Coulson's Chick Food is not very expensive. It is much cheaper to feed Coulson's Chick Food and raise big, strong chickens, than to feed by guess, a little of this and a little of that and not raise more than one-half of them. Remember Coulson's Chick Food contains everything required to fully nourish the chicks for the first two or three months.

All the trouble of hatching chicks is wasted if they don't live and grow.

If you like to see chicks dive into the feed as though they like it; you want to see the little chicks always spry and healthy; if you want them to grow rapidly and mature quickly;then you want to feed them the first three months on COULSON'S CHICK FOOD and you will be pleasedwith the way your little chicks are growing. It will raise the finest and largest chicks.

If you are going to raise any chicks this year. give it a trial.

It is composed of the best seeds and grains and PURE ANIMAL FOODS. A complete and perfectly balanced ration for growing chicks.

Coulson's Growing Chick Food analyzes about 18 per cent. protein. 60 per cent. carbo-hydrates. 7 per cent. minerals. 5 per cent. fat.

Coulson Poultry and Stock Food Co.

Vol. XXVI—No. 17 LOS ANGELES, CAL., FRIDAY, APRIL 27, 1906 Subscription $1.00 a Year

Making the Lawn and Subsequent Care

By L. C. Corbett, Horticulturist, Bureau of Plant Industry

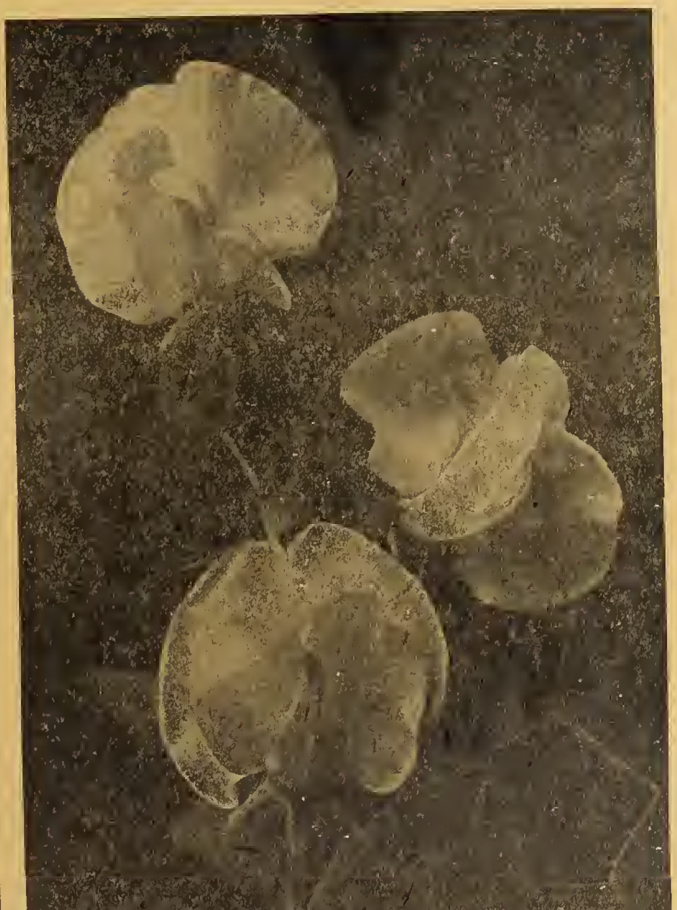
The greensward is the canvas upon which all architectural and landscape effects are produced. A lawn may vary in extent from a few square feet at the side of the steps leading to the brownstone front of the city dwelling to the broad acres of extensive parks. It matters little whether the extent of a lawn be great or small, its inherent qualities are the same, and its intrinsic worth is determined by its character and the manner in which it is kept.

Green grass is not only of great economic value, but it is also of great aesthetic value. The herbage of the field is the primary dependence of all animal life, and it is the green color, the sweet fragrance, and the soothing effect of nature which comes from well-kept greenswards that make them so congenial to man. Grass is nature's balm and healing for all erosive scars. Nature abhors rough edges and broken places, and immediately proceeds to cover such ugly spots with green grass. Man likes to get his feet upon the soil, but better still upon the soft, yielding greensward. Rich rugs and carpets do not give the elastic spring that the well-made and well-kept greensward yields.

A lawn is the accompaniment of effort on the part of man to beautify the surroundings of his abiding place. The great increase of interest in suburban and rural life has caused a corresponding increase in matters pertaining to the making and maintenance of lawns. Suburban railways, the extension of electric lines into the country, and the return of man to natural ways of living are all factors contributing to the growing interest in matters pertaining to lawn making.

In general, a lawn should be beautiful and it should be useful. Its beauty depends upon the contour of the land, the color and texture of the grass, and the uniformity of the turf. The use of the lawn is to provide a suitable setting for architectural adornment and landscape planting. Every device should be employed when working with small areas of ground to give the lawn as great extent as possible. The buildings should be well back, the foundation not too high, and the grading of the ground should be slightly convex—that is, a gently convex, rolling surface from the base of the foundation to the street line—rather than concave. A convex surface tends to give the effect of increased area, while a concave surface seemingly shortens distance. The extent of a lawn is also amplified by preserving as large areas of unbroken greensward as possible. This means the use of trees and shrubs only upon borders or margins of the lawn, rather than a promiscuous dotting of them over the greensward.

The ideal soil for a lawn is available in but few cases where it is desirable to establish a greensward. Ordinarily the lawn in which a man is most interested is that immediately surroundng his abiding place. The soil of this immediate locality is, in general, greatly modified because of building operations or necessary grading. The soil with which one has to deal, therefore, is seldom a normal soil of the locality. In general, it is a portion of the surface soil mixed with more or less subsoil which has come from excavation in making the foundation of a house. Large lawns and parks are not, as a rule, so subject to difficulties of this kind as are small private grounds. The problem before us, then, is that of converting not a normal but an abnormal soil into a suitable and congenial place for the growing of grasses.



ELIZA ECKFORD

Through the skill of specialists the sweet pea has become a much larger and lovelier flower than before it took such a strong hold on popular fancy Plants are more robust, dwarf, branching, and bloom earlier and more freely, some varieties showing 3 or 4 blooms on a stem. Many new colors, deep, dark, brilliant and delicately lovely, have appeared in the blossoms, often in combinations exquisite and indescribable. There are flowers, too, of quite distinct shapes, some of which are a great improvement upon the sweet pea of the old type.

The ideal soil for grasses best suited for lawn making is one which is moderately moist and contains a considerable percentage of clay—a soil which is somewhat retentive of moisture, but never becomes excessively wet, and is inclined to be heavy and compact rather than light loose and sandy. A strong clay loam or a sandy loam, underlaid by a clay subsoil, is undoubtedly the nearest approach to an ideal soil for a lawn; it, therefore, should be the aim in establishing a lawn to approach as near as is possible to one or the other of these types of soil. In many localities it will, however, be very difficult to produce by any artificial means at one's command a soil which will approach in texture either of the types recommended. Our efforts, nevertheless, should be directed to attaining as closely as possible these ideals

Whether a pure sand or a light sandy loam is the foundation for the lawn, a top-dressing of 2 or 3 inches of clay should be given and incorporated with the first 4 to 6 inches of the sand, and after this, if possible, the area should be used for the production of some green crop which gives an abundance of vegetable matter. Soy beans, vetches, and Canada peas are suitable for this type of soil improvement. These crops, if allowed to occupy the land until their maximum growth is attained and then plowed under, will act very beneficially upon the structure of the soil in making it more retentive of moisture, better able to hold fertilizers applied to it, and less liable to allow the greensward upon it to be killed out in times of drought.

Before definite preparations are made for the seed bed, the surface of the lawn should be reduced to the desired grade. In larger areas a gently undulating or broken surface is much more pleasing than a uniformly graded surface. Such a surface also adapts itself better to plantations of trees and shrubs. For small grounds of less than an acre in extent the grading should be comparatively uniform and of the simplest possible character. The general statement made in regard to the contour of the surface is sufficient guidance in grading such small areas.

Since the lawn is intended to be a permanent feature of the decoration of a place, its endurance or span of life is of unmost importance. In general, grass seeds are small and the surface seed bed for the reception of these seeds need not be more than one inch in depth; but since the grasses, as they become established, send out long, lateral feeding roots, it is necessary that the area containing the available food for these plants should be amplified. This object can only be attained by deep cultivation and thorough preparation of at least 8 to 10 inches of the surface soil. The soil to this depth should be made rich and should be put into an ideal condition for the development of plant roots.

The mechanical operations of preparing the soil can be carried on by the use of the modern plow if the area is large enough, or by spading if the area is small. The seed bed should be thoroughly and frequently stirred, so as to grind the soil particles together as much as possible for the purpose of reducing them to a uniformly fine condition and to liberate plant food. Cultivation should also have for its object the destruction of weeds which may interfere with the establishment of the lawn or which may be detrimental to it after it is once established.. After the soil has been thoroughly plowed or spaded it should be carefully fined by harrowing or raking, after which it should be thoroughly compacted by the use of a lawn or field roller and the surface again loosened by the use of a steel-

Deciduous Fruit Culture.

BY J. W. MILLS, POMONA, CAL.

CALCULATING THE COST OF COMMERCIAL FERTILIZERS.

In a recent issue we advised one of our subscribers to figure the cost of commercial fertilizers on the unit basis and we have been asked to explain it. If unit system is used by the wholesale dealers and the unit is one per cent or 20 pounds per ton, the following examples are taken from Harris and Myers:

Suppose we buy some dried blood said to contain 10.50 per cent of nitrogen, equivalent to 12.75 per cent of ammonia. It is said to contain 12.75 units of ammonia. Quoted at $2.50 per unit, a ton would cost $31.875. This would figure out a little more than 15 cents per pound for nitrogen. If it contained 10.50 per cent of nitrogen, or 210 pounds per ton, at 15 cents per pound it would cost $31.50.

If you can dissolve bone black guaranteed to contain 16 units of available phosphoric acid at 70 cents per unit it would be $11.20 per ton.

This is cheap phosphoric acid, only 3½ cents per pound.

For the purpose of converting certain chemical compounds into the equivalent of another the following rules are used:

To convert nitrogen into an equivalent amount of ammonia multiply the given amount of ammonia by 1.214.

To convert ammonia into an equivalent amount of nitrogen multiply the given amount of ammonia by .8235.

To convert a guaranteed per cent of nitrate of soda to an epuivalent of nitrogen multiply the per cent of nitrate of soda by 16.47.

To convert a guaranteed per cent of sulphate of potash to an equivalent of potash multiply the per centage of sulphate of potash by .54.

To convert muriate (chloride) of potash to an equivalent of actual potash multiply the amount of muriate of potash by .63.

To convert actual potash to an equivalent per cent of sulphate of potash multiply the per cent of actual potash by 1.85.

To convert potash of an equivalent of muriate (chloride) of potash multiply the per cent of actual potash by 1.585.

The grower cannot expect to get 2000 pounds of nitrogen. phosphoric acid and potash when he buys a ton of fertilizer containing them even if he does not want anything else. The nitrogen is a gas and has to be in combination with some base or heavy material and other gases. Potash is a basis of a strong alkali and can not be used pure. It must be mixed with either sulphur and oxygen when sulphate of potash is used or with chlorine when the muriate of potash is used. When sulphate of potash is used over half of its weight is made up of sulphur and oxygen. In every 100 pounds of potash there are 120 pounds of sulphur and oxygen.

In 100 pounds of actual nitrogen obtained by using nitrate of soda you must use 900 pounds of soda and oxygen. These two elements can be had from elements that are comparatively uniform in quality. but with phosphoric acid it is different. The bone may be raw (not treated with acid), in which case the phosphoric [illegible] not soluble in water and con-[illegible] very hard for the plants to use. It is then known as unavailable. It will require a chemical analysis to determine the amount of available phosphoric acid it contains. There will be found some nitrogen in the bone also, and the amount of that will depend upon how the bone has been treated. If phosphoric acid could be obtained in as pure and available a state as nitrogen or potash we would then have to use with 100 pounds of it about 600 or 700 pounds of lime. There are always a number of other minerals in the bone that we need not buy. but they go to make up the bulk.

Now, suppose we buy a ton of fertilizer that contains 1500 pounds of bone, 300 pounds of nitrate and 200 pounds of sulphate of potash, what should it be worth?

We will say—

1500 ℔ raw bone contains 3.5 per cent. nitrogen.........	52.5 ℔
300 ℔ nitrate soda, 96 per cent pure, 16 per cent. notrogen..	46.08 ℔
	98.58 ℔
1500 ℔ raw bone contained 21 per cent phosphoric acid....	315 ℔
200 ℔ sulphate potash, 50 per cent actual potash..........	100 ℔

Reckoning the phosphoric acid at 8 cents per pound, a high price for it in raw bone, 315 pounds will cost $25.20, making the raw bone cost $33.60 per ton, but the nitrogen in it is worth $11.20 per ton, making the actual phosphoric acid part cost $22.40 per ton.

Reckoning the nitrate at 16 cents per pound. 46.08 pounds will cost $7.37. which is for 300 pounds. or three-twentieths of a ton, equaling $53.60 per ton.

Reckoning the actual potash at 7 cents per pound. 290 pounds of sulphate of potash will cost $7, or $70 per ton.

Then we have—

1500 ℔ raw bone at $33.60 per ton	$25.20
300 ℔ nitrate of soda at $49.20 per ton................	7.37
200 ℔ sulphate potash at $70 per ton...............	7.00
2000	$39.57

Had this fertilizer contained but 280 pounds of actual phosphoric acid instead of 315 pounds it would have shown that 170 pounds of some kind of filler had been put in. The difference of 35 pounds of phosphoric acid shows that it was 21 per cent of the amount of bone that was missing.

THE ADHERENCE OF COPPER FUNGICIDES.

The Experiment Station Record gives a summary of experiments made to determine which solution of copper fungicide will stick the longest to plants upon which they have been sprayed. It has been determined by field experiments in nine different districts. The different solutions being sprayed upon the vines in 2 or 3 per cent. solutions for the Bordeaux mixtures and one per cent. solutions for the verdigris. Eighty gallons of spray material per acre having been used for the first treatment, and 100 gallons for the fourth treatment. Summerizing, the adhesiveness of the different solutions may be ranked as follows, based upon the average of all the investigations. Natural verdigris was the most adherent, followed by what is called an adherent mixture of verdigris, Bordeaux mixture, and Masson's mixture. All the solutions were found to be more adherent if applied fresh. Bordeaux mixture preserves its adherence for a long time if the temperature is high, while some other mixtures and especially those containing soap rapidly lose their adhesiveness when the temperature becomes very high.

DRY ROT ON GRAPES.

The French experiment stations have been testing sprays for this troublesome disease, in both the liquid and dust form. In addition, comparisons were made of the effect of removing part of the leaves and reducing the amount of nitrogenous fertilizers. In all, six forms of powder and about one dozen of liquid were used in the tests. The results showed that in a season unfavorable to the development of this disease, no treatment seemed to show any reduction in the disease from that observed in the check plots. but observations show that in seasons favorable to the development of the disease fungicides are of much benefit. The disease seems to thrive most when there is an abundance of nitrogen in the soil. This is no doubt due to the vines putting on a more dense foliage which in turn makes the conditions favorable for the development of the malady.

MULCHING STRAWBERRY VINES.

Experiments in mulching strawberry vines at the Tennessee experiment station showed that when field bean straw was used, the plants made a much better growth than when mulched with grass. This is a good thing for strawberry growers in the California bean sections to know.

MILDEW ON GRAPES.

In a French bulletin the author recommends washing grapevines with a mixture of water 100 liters, sulphuric acid 15 liters, and sodium hyposulphite 1 kg.

This application should be applied to the vines between December 1 and February 1, or an application of a 10 per cent. solution of sulphuric acid may be used. This should be followed during the season with other treatments, for the first of which is recommended a mixture of copper sulphate 1.5 kg., lime 0.75 kg., and water. For later treatments the quantity of copper and sublimed sulphur is increased about 50 per cent. These proportions will make about 1 hectoliter of fungicide.

STRINGFELLOW METHODS.

In the Rural New Yorker is an article in which the author reports that fruit trees root and top pruned according to the Stringfellow method have not succeeded as well at the Missouri station as trees planted and pruned in the ordinary manner.

Peaches have been less injured by the Stringfellow method of pruning than apples, and where the trees pruned according to the Stringfellow method have lived over the first summer they have invariably developed into good trees. The author notes that some commercial growers throughout the state report excellent success in planting and pruning according to the Stringfellow method, and others much better results by the usual method.

It is believed that the method of stub-root pruning and cutting the stock back to 12 to 18 in., according to the plan advocated by Mr. Stringfellow, has been of great service in showing that it is not necessary to retain anything like the large quantity of fibrous roots which was formerly supposed. Many large growers are now cutting back the roots of trees much more severely at planting time than heretofore.

Practical Farm Science

PREPARING LANDS FOR IRRIGATION.

The United States Department of Agriculture has issued Bulletin No. 145, of the office of experiment stations, describing methods of preparing land for irrigation and applying water to crops in different sections of the arid region of the United States. In this bulletin the methods of getting rid of sage brush, smoothing the ground, building laterals and distributing water over the fields as developed by the experience of farmers in irrigated districts are brought together and described. The tools and implements used are illustrated and the cost of the work based upon actual examples in different states, are given. The purpose is to afford beginners a reliable guide both as to the cost of bringing wild land under cultivation and methods best suited to different soils, climates and crops. The facts included in this bulletin have been gathered by the irrigation investigations of this office, acting in co-operation with the State experiment stations and state engineers' office.

The bulletin brings out the fact not well understood, that the cost of preparing the land for irrigation is in many instances greater than the cost of building canals and reservoirs. Detailed figures of the cost of checking land show that it varies in certain districts in California from $9.96 to $18.08 per acre. This is more than twice the cost of the canal system in the San Joaquin Valley, California, which is given in the report of the Census Bureau for 1902 as $4.99 per irrigated acre. Where the preparing of the land is contracted for the cost of checking varies from $7.50 to $20 per acre. The price of preparing land for flooding is much less, but is $5 per acre in Wyoming. The need of a better understanding of this particular branch of irrigation practice is becoming more and more important. Reservoirs and canals are but means to accomplish a purpose. That purpose is to increase the products of the soil. The value of the ditch or reservoir depends upon the acreage of land which it will serve and the increase in the value of the products which the use of water will bring about. The time is coming when the most important problems connected with irrigation will be the best means of applying water and not, as at present, those of canal and reservoir building.

About thirty different methods of applying water are now in use. This does not mean that there are thirty distinct systems, but includes the different ways of preparing land by checking, compartments, deep and shallow furrows, flooding, sprinkling and subirrigation. This bulletin gives some of the results of a series of different methods of applying water and the difference in loss of water by evaporation in deep and shallow furrows and in flooding. About one and one-half times as much water was needed to irrigate an acre of land by flooding as was required in furrows twelve inches deep. About one and one-third times as much water was needed to irrigate in furrows three inches deep as in furrows one foot deep. A saving of one-third of the water by the adoption of a better system would mean not only increased profits to farmers, but a large increase in the acreage which would be irrigated from canals or reservoirs.

COST OF TILE DRAINAGE.

The basis of an estimate of the cost of drainage per acre is the cost of individual drains of different sizes laid at different depths. Until such data is known no correct estimate of the cost of the drainage of a given tract can be made. A drainer of experience may look at a field or farm, and from his knowledge of the cost of work which he has performed on similar land may approximate the cost per acre without knowing definitely what material will be required. The most convenient unit to use in making estimates is the 100-foot length of finished drain. In systematic drainage he should know how many feet of lateral drains will be required per acre. To illustrate the matter in hand we may say that one acre, drained with parallel lines 33 feet apart, will require 1320 feet of drains; at 66 feet, 660 feet; at 100 feet, 440 feet; at 150 feet, 290 feet. Supposing that the lateral are to be 4-inch tile and cost $1.50 per 100 feet laid on the ground, and that the digging of the ditch and laying the tile will cost $1.50 per hundred feet, and filling of ditch 5 cents per hundred feet, the completed ditch will be $3.05 per 100 feet. This is for a depth of 3 feet to 3½ feet. If greater depths are necessary an increase of 6 cents per 100 feet should be added for each inch of depth beyond 3½ feet.

Using the above figures, an acre drained 33 feet apart would cost $40.26; 66 feet apart, $20.14; 100 feet apart, $13.42; 150 feet apart, $8.95. To this must be added the cost of intercepting or outlet drains, which should be charged to the entire tract for which they afford drainage. The expense of laying out and superintending may be put at from 5 to 8 per cent for ordinary work. These are the elements entering into the cost of tile drainage. In the above example the entire area is to be drained at some uniform distance apart. Such drainage is done by treating the lower levels which gather the drainage water from the higher areas. This is done with comparatively few lines, and the cost, when charged against the entire farm, may not run higher than from $4 to $7 per acre. Such farms are called "tiled farms." They cannot be said to be underdrained. In some instances an expensive outlet must be provided by means of a main which passes through the lands of adjoining owners.

With such varying contingencies attending the work of draining land, it cannot be expected that the price at which one tract of land is drained will form a criterion by which to judge of the cost of another, only as the two may resemble each other in location, soil and general requirements. Each tract should be estimated separately. The rule of averages does not apply in estimating the cost of tile drainage.

BIRDS VS. FRUIT.

Bird life in California has been on trail by the United States Department of Agriculture and the verdict, in the main, is not guilty. Some minor offenses have indeed been proved, but extenuating circumstances in nearly every case justify an acquittal. Fruit growers have a very general prejudice against birds, bringing against them charges of destruction that it would be hard to substantiate. The report of the Department of Agriculture ought, therefore, to be carefully read in order that the farmer may not unwittingly kill or banish his very good friends.

CONTROLLING GREEN SCUM.

Experiments at the Nebraska Station in tanks supplying water for stock are briefly reported, the conclusion reached being that "tanks may be kept free from green scums by treating with copper sulphate at least three times during the heated portion of the summer. Adding the copper sulphate directly at the rate of one-half pound copper sulphate to 75 pounds of water is the more effective method of treatment. Where this treatment is used the copper sulphate should be placed in a coarse sack and drawn back and forth through the water until dissolved."

PRUNING AND THINNING DECIDUOUS FRUIT.

The pruning of deciduous fruit trees begins at the time or planting, and must be practieed continually while the trees live. When apricot trees are planted they should be trimmed to a single stem, and cut off at 18 to 20 inches from the ground. These will throw out shoots vigorously, and frequently two or three shoots from one butt. The shoots must be thinned out, leaving not more than four or five, no two of which should come from one bud nor be directly opposite.

The first shoot should start twelve inches from the ground, and the others in such a manner as to divide the space and make the branches balance leaving the top shoot to make the central part of the tree.

It will be necessary to go over the trees several times the first year to remove shoots that may start where not wanted, and this is more readily done while the shoots are tender enough to pinch out. No general heading back should be done the first year, as it tends to dwarf the tree, though if some of the limbs are making an overgrowth they should be pinched back.

The pruning for the second year should be done in January, as the trees will not be dormant until then if they have been kept in a thrifty condition. The first year's growth should be cut back to within five to ten inches of the body of the tree, and all forks should be cut out, even if it necessitates forming a new head, for it is much better to lose some growth on a young tree than to take the risk of splitting down when the tree begins to bear fruit.

When the shoots start for the second year's growth take off all that come out on the under side of the limbs and thin to two or three as may be needed to balance the tree, bearing in mind that an apricot tree always inclines toward the coast breezes.

The second year will require much more attention than the first year, in order to keep off suckers and all lateral growth that may start on the under side of the new limbs, the object being to make the limbs grow as near upright as possible.

The remark on heading back holds good for this year also.

The trees will become dormant earlier the second year than they did the first, but ought not to be trimmed earlier than January, so that the ends of the limbs will not be exposed to the drying winds so long before the sap begins to flow, and consequently will heal over better.

The second year's growth should now be cut back to within fifteen to twenty inches of the old wood, except the central stem, which may be left twenty-four to thirty inches long, depending on the number of laterals it may have thrown out.

When the new shoots have about six inches growth they should again be thinned down to two or three leading limbs on each branch, and all taken off that tend to turn down or out at right angles; but do not take off the fruit spurs. The trees will need to be gone over about three times before July to remove suckers and lateral growth that may start on the lower side of the limbs, as the tendency in the third year is to make an immense growth of downward laterals, and these must be taken off so as to develop wood that is to be left for fruit. If the orchard is on good land and has been properly watered and cultivated the trees should now be large enough to begin to yield fruit.

The object in trimming during the first two years and the first half of the third year, has been to grow a vigorous upright tree with strong limbs, capable of carrying a heavy load of large fruit and to get the fruit as close to the body of the tree as possible.

There will be a few specimens of fruit the third year, and as soon as these are gathered the trees should be summer pruned for the first time, care being taken that the land shall have been allowed to become moderately dry, so that the trees may be partially dormant. If the downward growth of laterals has been kept cut off, all that remains to be done is to cut off about one-half of all this season's growth all over the tree, using the same judgment as before with reference to prevailing winds and symmetry of tree.

The only pruning that will be necessary the following winter will be to take out cross limbs and sprouts that may have been overlooked in the summer.

When the tree comes into full bearing they will require but little pruning, though all the long shoots that come out should be cut back as soon as the fruit is gathered, for the fruit on these twigs and slender limbs is always small and exposed to sunburn.

When peach trees are planted they should be cut back to a single stem, and cut off at 12 inches from the ground, but instead of allowing a trunk to be formed below the branches they should start branches at the ground, as well as along the stem. Particular care should be taken that these branches grow nearly upright, so as to form a thick, self-supporting tree.

The pruning for the second year should be done in January, when about one-half of the last year's growth should be cut off, and the tree thinned so as to make it balance.

The new shoots will start at the base of the limbs that have been cut back, as well as at the point, and those at the base should all come out this year. A good rule with peach trees is to cut off about one-half of the last year's growth for four or five years.

PROFIT IN FERTILIZING

ARMOUR'S BLOOD BONE AND SINEW FERTILIZERS

depends as much on judicious purchasing of fertilizers as on the intelligent study of the requirements of the crop.

When you buy fertilizers

POTATO BLIGHT.

We have never suffered very seriously from potato blight in this State. but that is no sign that we never shall. In the Eastern states it is a very serious disease in the important potato-growing districts, especially what is known as the "late blight," which is very difficult indeed to subdue. The remedy is the Bordeaux mixture, and successs depends on the persistence and thoroughness of the application. In regard to this trouble a correspondent writes:

"I believe that there are many farmers who still do not understand the principle of spraying for blight, and until they do they never will do very much effective work in bad years.

If we could dip a hill of potatoes into our spray mixture four or five times during its growth period that hill never would be struck by blight or its tubers by rot, for we would have coated leaf, stem and stalk, the under side of the leaves as well as the upper.

Now if we went over a field of potatoes with a sprinkler and did a very good job coating the top of the leaves, and weather conditions were favorable, we might not have much trouble with blight; but suppose we get a strong wind (with other conditions favorable to blight growth) which blows out the vines badly, exposing the under side of the leaves, these, having no spray mixture on them, because it is impossible to get it on the under side of the leaves with a sprinkler, would be open to the attack of the blight spores, and our field would not be much better protected than if we had never gone over it. How often we hear some farmer say: "I went over my potatoes with Bordeaux, and they were all right until we got a heavy wind, and then they were black in a few days," simply because the wind had blown the under side of the leaves where the blight spores could the more readily land upon them, and being unprotected by any mixture, were open to attack.

The more force we get to our spray the better work will be done, as it will be forced in among the foliage. I have never been able to do first-class work with the five-gallon compressed air or knapsack sprayer. Better work can be done with a good four-rowed handpump machine, but even this will not do here on the Coast; a power spray where a working pressure of from sixty to seventy pounds can be maintained, is needed.

The sal-soda-copper-sulphate mixture gave better results as spray mixture in our experimental field this year than the regular Bordeaux, and, I believe, is destined, in bad sections for blight, to take the place of the regular Bordeaux. This is made by using sal soda in the place of lime in making Bordeaux mixture, and does not leave anything whatever in the mixture to clog the nozzle, as lime is apt to do unless the mixture is made right.

AGRICULTURAL NOTES.

Make good use of the sun extractor. Generally one-half ounce of comb will hold one pound of honey.

Bee men have no winter problems in California.

Colonies with young queens are not so apt to swarm as those having older ones.

Italians will resist robbers much better than the black or hybrid bees.

The bee man who reads is the man who succeeds, because he is a man that wants to keep up with the times.

When looking for a queen it is well to remember that she is more easily found on a fine day when most of the bees are afield gathering nectar.

Sixty pounds of surplus honey per colony in a season is a fair average in most localities.

The color of honey varies greatly, ranging from water white to a very dark brown.

Bottled honey should be of fine flavor and light in color, dark honey looks bad in glass and is a drug on the market.

Light colored honey is gathered from such flowers as clover, alfalfa and mountain sage, while the dark is gathered from buckwheat and autumn flowers.—M. D. Whitcher.

Of Interest to Fruit Growers

Sometimes it pays to take the first market. Sometimes it pays to wait until your fruit is dried. I will furnish free to all producers of Dried Fruits a compilation of the stocks of Dried Fruit in all the largest cities in Europe and the United States. After seeing this report you will know when to sell and at what price. My estimates were correct in 1904, when prunes sold at 1 3-8 bag basis. I estimate apricot and peach prices. Contracts made by or through me will be safe. I never have had a draft rejected or unpaid. Reference: American National Bank, and Bank of California, San Francisco.

Apple Trees

5 to 7 feet, one year old, $20 per 100. Grown in Riverside. Clean and healthy. *Cornichon Grape Vines,* $25.00 per 1000.

Jurupa Nurseries, Riverside, Cal.

With the Citrus Growers

BY J. W. MILLS

CITRUS FRUIT GROWING IN THE GULF STATES.

Farmers' Bulletin No. 238 treats of this subject in a concise form and sums up the occupation as follows: "The growing of the finest citrus fruits is a horticultural accomplishment not surpassed in any line of the art. There are very few agricultural occupations that require an equal amount of judgment and very few that give as remunerative a return for the mental outlay. Everyone who is willing to pay the price, either in labor or in dollars, can grow oranges and grape fruit, but only he who is so constituted as to derive pleasure in exercising his mental faculties to their fullest extent can produce fruit of the finest quality. There is a very long series of conditions, from the choice of the stock into which the bud is to be placed to the delivery of the package of perfect fruit to the consumer, which must be met successfully. If any one of these links in the chain is broken, first place cannot be obtained. Good judgment with previous knowledge must be exercised in the choice of stock, the bud, the soil, and the location of the orchard, in the cultivation of and the fertilization of the crop, in the treatment of fungus and insect diseases, in picking and packing the fruit, and in selecting a market for its disposal.

The production of the finest oranges requires years of most careful study and as diligent attention as the most intricate business operation. Unless the citrus grower is in full sympathy with his surroundings and in love with his work, he will as surely fail to produce the best results as would be the case in any other occupation."

These comments are certainly applicable to California as they deal with men and methods, but in the discussion of the climatic conditions that govern citrus culture in the Gulf region, the points covered do not apply to California at all. In that region it is stated that where the temperature does not fall below 18 degrees above zero nor rise above 100 degrees, and where there is sufficient moisture, citrus fruits may be raised, intimating that the best fruit is not always raised where those limits are reached, though as a rule, such limitations mark the locations in which it is considered safest to grow citrus fruits. In that region it is considered impossible to grow oranges if the rainy season comes during the time the oranges are maturing as it interferes with gathering and marketing. We do not consider this a serious disadvantage, in fact the bulk of our fruit is harvested and marketed during our wettest season. It is not an uncommon occurence to hear a grower who is in the midst of harvesting his crop, state that he wished it would rain and stop the rush of fruit to market, fearing that the large shipments would have a depressing tendency on the prices. It often happens that a rainy period will cause the market for oranges to strengthen.

The bulletin states that the more nearly the northern limit of the citrus belt is reached, the more sprightly and deliciously flavored is the fruit, some of the best being grown where the trees are in danger of being frozen out.

An ideal climate is described as one where the rainfall occurs after the fruit has been shipped and before the new crop begins to ripen, and where there is not a continued cold of less than 26 to 27 degrees, and preferably not above 100 degrees. A temperature 18 above zero while the trees are dormant will strip the trees of their leaves and if the sap is flowing it will kill the trees to the ground. These conditions do not prevail in this state as there are numerous places where the lowest temperature above mentioned does not cause a serious dropping of orange leaves and the trees are not seriously injured. We, however, do not know what would happen should we have a severe freeze while the trees are in a state of rapid growth. We do know, however, that freezes which will kill almonds that are practically full grown, will not affect the blossoms of orange trees, showing that the orange has a remarkable resistance to cold in our climate.

TIMELY HINTS.

If there is any one thing that can be depended on to conserve the moisture in the soil and utilize that in the atmosphere, it is deep cultivation. This has been fully demonstrated by experiments carried on at Berkeley, as deeply cultivated soils showed much more moisture than those that were cultivated shallow, and where irrigating water is scarce now is the time for plowing or cultivation before the heat of summer sets in. It will be found that this deep cultivation will develop moisture in the soil from the condensation of the moisture of the atmosphere in the cooler soil, especially where there has been a liberal use of stable manure or plowing under of green fertilizer.

There are many who have been resting, comparatively, from cultivation for the past months, but now the ground must be put in order for the summer either by plowing or cultivation. Thorough work will enable the soil to imbibe much more rain if it should fall and it will not be safe to leave it too long, hoping for more rain, before stirring, for experience shows that we cannot always depend on enough rain to do any good after the 1st of April. The season hinges on what rainfall we get before that time.

The rains came very opportunely and the weather stayed cool and damp for an unusually long time this spring, giving all ample opportunity to prepare for the growing season by plowing, cultivating and generally getting rid of all weed growth left over from the winter. If the ground was left in a fine state of tilth it will be found that the crop of summer weeds will begin to make their apearance above ground, and the sooner after that the ground can be gone over with a light harrow or cultivator the better, as they rob the ground very quickly of any moisture that may be left in it. We may still look for showers which will be a very great help in getting the surface of the ground in good condition for the coming season.

HOW LIME ACTS.

Lime enters into the composition of all plants and is undoubtedly as much a plant food as potash, phosphoric acid or nitrogen. A plant will not grow in the absence of lime, but this substance is so widely distributed in nature that practically all lands contains sufficient lime to supply the needs of the plants that may be grown on it.

The benefit derived from an application of lime is due more to its chemical and physical action on the soil than merely an increase of lime available as plant food.

Without going into detail the following are the chief chemical changes brought about through the agency of lime:

Lime as sulphate has the power to break up certain compounds containing potash in an unavailable condition. It also aids in the formation of double silicates of potassium and aluminum in which form the potash though available, is prevented from leaching out the soil. It promotes a rapid decomposition of the organic matter in the soil and causes its nitrogen to be converted into nitrates. This is the form in which nitrogen is best assimilated by plants.

If there is an excess of soluable phosphoric acid in the soil, its tendency is to combine with compounds of iron and aluminum and become unavailable. The presence of lime prevents this, and is even believed to be able to decompose any iron or aluminum phosphates which are in the soil so that the phosphoric acid may be utilized as plant food.

Thus it appears that lime, by its peculiar chemical properties, is capable of rendering available all three of the plant foods which may be in the soil in an inert form.

Another important function of lime is to correct the acidity of soils which are rich in organic matter. Such soils are frequently so sour that certain plants will not grow on them, yet they produce abundant crops after an application of lime. A moderate amount of lime also greatly facilitates the growth of nitrifying organisms which exist on the roots of leguminous plants and causes the nitrogen which these little helpers secure from the air to be converted into nitrates and in this form stored up in the soil.

For Sale--Orange Trees
To clear the ground will sell some of the finest Washington Navel Orange Trees that you ever saw, cheap.
H. M. Cole, Pasadena, Cal.
Third House South Hill Ave. Sunset Phone 450

Citrus Trees
—All the Standard Varieties—

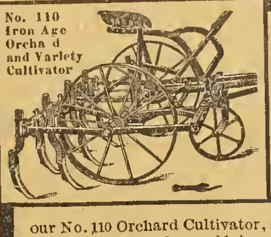
When writing advertisers mention Cultivator.



No. 110 Iron Age Orchard and Variety Cultivator

CULTIVATION PAYS
An old saying, "Tillage is manure," applies closely to all cultivation. It has been proven that it pays big money to till the orchard; in fact, no orchard can be kept in a paying condition without it, since larger crops, better quality and top prices are the direct results. In the family of famous
Iron Age Implements
our No. 110 Orchard Cultivator, shown in cut, will be found invaluable as a money maker and labor saver for the farmer and fruit grower. It may also be adapted to other than orchard uses.
The No. 6 Combined Double and Single Wheel Hoe, Hill and Drill Seeder, is also a sure money maker in its special field. A new free book, "Iron Age," describes other labor-saving, money-making implements, including Horse Hoes, Potato Planters, Sprayers and Fertilizer Distributors, etc. Send for it to-day.
NEWELL MATHEWS CO., Los Angeles, Cal

No. 6 Iron Age Combined Double and Single Wheel Hoe, Hill and Drill Seeder.

ORANGE TREES
Oldest Established Citrus Nursery in California, at Alhambra, Los Angeles County
Late Valencia and Washington Navels, Lisbon and Eureka Lemons. Guaranteed true to name. No better trees in this State. Lowest market price. Three-year buds, four-year roots. Horticultural Commissioner's certificate. Order early, as good trees are scarce. Inspection invited.
E. G. Wood, Owner, at Nursery or Room 732 Huntington Building, Los Angeles, Cal.

The Ornamental Garden

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

LARKSPURS.

The Larkspur (Delphinium) is a genus that includes annual, biennial, and perennial species, most of which produce flowers of varying shades of blue. The annual kinds, mostly varieties of Delphinium Ajaceis (the rocket larkspur), and D. consolida (the branching larkspur), are hardy plants that are largely grown for garden decoration. They are very showy, and in addition to blue produce flowers of pink, scarlet, white, purple, and other colors, and double or single blossoms. The rocket varieties are said to contain a principle that is poisonous or obnoxious to certain insects, and are often specially planted in gardens in districts subject to invasions of grasshoppers as a check against their ravages. Seeds of the annual kinds should be sown in autumn.

The perennial kinds are worthy of general cultivation, particularly species such as cardinale and nudicale that bear scarlet and crimson flowers, and sulphureum, the yellow flowers of which are used for dying silks in Syria, but it is on account of their beautiful shades of blue that Larkspurs are specially valuable as garden plants. The flowers are borne on spikes often five feet in height. The colors of the newer hybrids are almost indescribable, and embrace almost every possible shade of blue and purple. There are single and double flowered varieties. In addition to the greater variety of color, the garden varieties are larger in spike and flower and generally more floriferous than the parent species. They endure great heat without flagging in the least, if supplied with a fair amount of moisture, and in fact there is no flower grown in our gardens that can compare with Delphiniums in that respect.

To grow Larkspur well they should be planted in beds specially prepared for them; sheltered from rough winds, but not unduly shaded or close to large trees. They thrive best in a friable loam that has been deeply worked and well manured. Rotted stable manure is most suitable in such soils; a mixture of equal parts of rotted cow and stable manure for soils of a sandy nature. The plants need a fair amount of water during summer, and as little as possible during winter, so well drained beds are essential. The beds should be prepared during winter, and the plants set out in spring. The beds should be mulched early in the season, by which means strong plants are assured in one year even without the application of much water. The stems are brittle, and one stake at least will be required for each plant. After the main shoots have blossomed they should be cut away unless required for seed (which should be saved from the main spike of the finest kinds only) after which the side shoots will flower. When the stem has finished blooming it should be cut to the ground, when other shoots will follow. Delphiniums are most effective in mixed borders, in which they should be planted well back from the edges.

Old plants should be carefully divided in the spring, leaving one or more crowns to each division. Small pieces even if not supplied with roots will grow into fair plants, but require more attention in watering and cultivating. Larkspurs are easily raised from seed, which should be sown in autumn and winter in boxes or pans of fibrous soil. A succession of young plants will insure flowers during the whole of the summer and autumn, the plants blooming a few months after the seed is sown. Slugs and snails, if present, are sure to attack the young plants, and provision must be made to prevent their access to the young seedlings. If no such enemies are present, the seed may be sown in the open ground, and the seedlings transferred to their flowering quarters when about two or three inches in height.

GROWING POND LILIES.

The simplest and most economic way to grow water plants is a collection of large tubs or half hogheads, located in a sunny position and partly filled with soil. A much better plan is to make a pool by excavating the ground two or three feet. The walls should be made of brick, stone, or concrete, using cement for all the work. There should also be a waste-pipe at the bottom with a stand-pipe for overflow. In a basin eight or ten feet across quite a variety of plants may be grown, using wooden boxes or shallow tubs to hold the soil.

Those having fountain basins in their grounds can utilize them in the same manner. It is not necessary that there should be a continuous flow of water, but during the growing season enough should run in each day to prevent stagnation and to keep the plants in health.

While most water lilies will flower freely in contracted quarters, they will attain greater perfection, with much larger flowers, if they have abundance of room for both the roots and the leaves. Basins twenty to thirty feet in diameter, or even larger than this, are desirable for growing a good collection. In growing the lotus in the same basin with Nymphaeas, care must be taken to confine the roots of the former to a given space, as it has the habit of spreading in all directions.

COUNTRY SCHOOLS.

The rural school suffers more from inexperienced and poorly prepared teachers than from any other one cause. I hasten to say that not all teachers in the country districts are with little or no experience and of meager education. Some of our very best teachers labor from choice in the country. And then it often happens that the young teacher. with her first school in a remote country district, does a work of the very highest merit. I am persuaded that much of the teaching done in the one-room country schools will bear favorable comparison with the best teaching in our cities. No teacher who labors in the country need apologize for that fact; neither should she feel that the work given her to do is of any less importance than that undertaken in the more pretentious city position.

Country children are in most respects most happily situated. The beauties of nature smile upon them. and her myriad voices call to them in the solitude of field or forest. They have a healthful environment. The example of virtue and honor in the home and in the community is in the main before them. Duties many and continuous await them, and their labor is directed to definite ends. They have time for quiet reflection and opportunities to use their reason and judgment. Their environment is well suited to develop a strong body and an active, vigorous mind. No class of our youth gives greater promise of usefulness. These country children deserve and have a right to demand school privileges in every way equal to those accorded the children of towns and cities.—Hon. John Riggs. Iowa. State Supt. of Schools.

PUDDLING TREE ROOTS.

Since the adoption of the plan of puddling roots of trees before packing or planting by many nurserymen, its benefits have been so manifest that one by one many of the others are following in their wake. In truth, it is a very great help to trees. The puddle is formed by taking some heavy soil, throwing it in a large tight box set in the ground, and mixing it with enough water to form a thick paste, into which the roots of the trees are plunged. It must be thick enough that when the roots are withdrawn from the puddle there is a thick coating of mud adhering to them. Whether for shipping or for planting it has been found of the greatest use in preserving the stock in good condition, as it naturally would. There is a moist coating of soil close to the roots, affording moisture and keeping out air; and this, as all planters know, is half the battle for success with the trees.

OUR WHITE FIR.

Abies lasiocarpa is the Californian representatives of the A. concolor of Colorado. Both are desirable, the latter the more so to those living in the colder states. A. concolor is a lovely evergreen.

We sell country lands. CHATFIELD & VINZENT, 228 Montgomery St., San Francisco, Cal.

Sycamore Grove Nurseries

We do Landscaping in all its branches, but also carry a full line of Ornamentals and Fruit Trees. Several different varieties of Acacias and Eucalypti. Send for our prices.

SAINT & WARNER,
4584 Pasadena Ave. Los Angeles, Cal.

ROSES

All the best garden sorts, in fine vigorous plants, at proper prices.

Palms, Pines, Acacias, Cypress, Camphors, Encalyplus, Guavas, Budded Loquats and all kinds of Ornamental Trees. Be sure and visit the Nurseries. A cordial invitation to all. Nurseries, 200 yards west of Loara Station, S. P. R. R. Our fine Illustrated Catalogue free. Write for it.

In the Vegetable Garden

BY ERNEST BRAUNTON

THE SOY BEAN.

This leguminous plant, probably native in China, is the most important legume of China and Japan. Its remarkably high percentage of protein (34 per cent) and fat (17 per cent) attracted the attention of Europeans some twenty-five years ago. Since that time it has been cultivated to some extent both in Europe and America, chiefly as a forage and soiling crop. In the Orient this bean and the various food produts made from it are so largely consumed that it is perhaps the most important food plant next to rice. The soy bean is eaten to a small extent boiled like other beans, but in China and Japan it is elaborated into a variety of products, all of which have a high percentage of protein, and when eaten in connection with the staple food, rice, which is so deficient in that constituent, helps to make a well-balanced dietary. Some one of these products is eaten at perhaps every meal, and by rich and poor alike, especially in the interior of these countries, where sea food is not obtainable. One of the most important of these preparations is shown, and it is the only one that has been introduced to any extent into other countries, here it is shown as soy sauce. To make it, a mixture of the cooked beans with roasted wheat flour and salt is fermented for some years in casks with a special ferment. The result is a thick brown liquid having a pungent and agreeable taste.

There are also several varieties of bean cheese or similar products made from this legume which are very important foods. These are natto, miso, and tofu. Natto is made from soy beans that have been boiled for several hours until very soft, small portions of the still hot mass being wrapped securely in bundles of straw and placed in a heated, tightly closed cellar for twenty-four hours. Bacteria, probably from the air or straw, work in the mass, producing an agreeable change in its taste.

For tofu, the soy bean, after soaking and crushing, is boiled in considerable water and filtered through cloth. To the resulting milky fluid 2 per cent of concentrated sea brine is added, which, probably by the virtue of the calcium and magnesium salts present, precipitates the plant casein, which is then pressed into little snow-white tablets. Tofu is sometimes cooked in peanut oil before it is eaten. In natto and miso the action of minute organisms play an important part. In tofu there is no such action.

WINTER BLIGHT OF TOMATO.

The control of this disease has been thoroughly worked out in Eastern States for potatoes, and in the same method will no doubt prove effective here. Treatment consists in spraying with Bordeaux mixture; in climates with frequent rains in summer this is done several times at regular intervals, in order to keep the vines well covered with spray at all times. In California this would not be necessary. Spraying should be regulated entirely by the rainfall. If there is no rain there is no danger whatever of winter blight, and no need of spraying.

If rain occurs while the vines are in growing or bearing condition, spray thoroughly with Bordeaux mixture immediately after the rain stops. If there should be frequent showers a day or a few days apart, spray between showers rather than wait too long. Aim to cover the fruit and all parts of the vine with the spray. If the mixture shows on the fruit when picked it can be easily wiped off. Bordeaux mixture is not poisonous. Repeat the spraying after the next rain, if any occurs; but continued spraying in dry weather is not necessary. One good spraying at the right time last fall would probably have saved thousands of dollars in the winter tomato crop.

It is advisable, in regard to this disease on general principles, not to plant tomatoes on the same land one year after another, although the Phytophthora spreads so rapidly when conditions are favorable that this precaution could have little effect in preventing the blight.

THE VEGETABLE GARDEN.

Whenever a choice is possible for the growing of vegetables a site protected on the north and northwest by a hedge, fence, or any natural wind break, is to be preferred. If the ground is not level, a gentle slope to the south is the best. A garden so situated will produce the earliest crops.

A very important factor in the growing of vegetables is good soil. A light sandy loam, which will warm up early in the spring, will produce the earliest crops, but a soil that is a little heavier is the best for growing good vegetables in the summer and fall. Whenever possible, avoid a sticky,, clayey soil.

There are a good many diverse opinions as to the proper time to plow the vegetable garden, but the gardener is generally governed by the conditions of the soil he has to handle. Whenever practicable plow with a two-horse plow and plow deep. A good, thorough plowing will be beneficial for the whole season.

A good top dressing of well-rotted stable manure (cow and horse manure preferred) spread broadcast and plowed under before it dries out is the best for growing vegetables. In all well-ordered gardens you will generally find that a good high fertilizer and nitrate of soda is used to push along certain crops, such as celery, cabbage, onions, lettuce, corn, etc.

Before beginning to plant, it is a very good idea to have a definite plan of the garden. If possible, plant in long, straight rows, so that the cultivation can be done with a horse plow and diamond-toothed cultivator. Have all permanent beds, such as asparagus, strawberries, etc., to one side, so that they will not interfere with the plowing.

Try and keep your garden free from weeds by thorough cultivation. The proper time to kill weeds is before they come up. But whether your garden is clean or dirty, keep a horse and cultivator going through it every week or ten days to keep the ground soft. If your ground shows a tendency to bake after a rain, cultivate, and it will serve the double purpose of softening the ground and making it hold the moisture longer.

LABLAB BEANS.

There are several kinds of beans which, though articles of diet in Oriental countries, are used only to a limited extent in the United States, usually by Chinese or other residents of foreign birth or extraction. Lablab beans, asparagus beans, and mungo beans may be mentioned. The green pods of the asparagus bean are largely used as a snap bean. The pods are long, containing 10 to 16 seeds, more slender than the string beans and more slightly rigid along the middle of the two valves. Under the name of "tou kok" this vegetable is cultivated by the Chinese in some regions of California and is said to be finding favor with the white residents and is considered a valuable variety of the snap bean.

THE COW PEA.

The cow pea is grown both as a forage and for human food, but mainly as a fertilizer for the soil (green manure). Considerable quantities of the cow pea are consumed during the season, being gathered when the pods begin to change color and before they become dry. For winter use the dry peas are cooked like other dried beans and have a very agreeable flavor.

ANNOYING.

Mr. Gardner—Well, dear, how are the tomatoes you planted?

Mrs. Gardner—Oh, John! I'm afraid we'll have to buy what we need this year.

Mr. Gardner—Why, how's that, Mary?

Mrs. Gardner—I recollected today that when I did the planting I forgot to open the cans.—Puck.

Intensive cultivation should be practiced at this season in the vegetable garden to conserve the soil moisture.

CAPITAL PRIZE.

"Do you oppose the lottery down at our church?"

"Not me. I won a prize."

"You don't say so?"

"Yes, I married the young lady who had charge of the booth."—Chicago News.

It has been said that great wealth is an obstacle that prevents men from getting into heaven. We know of some that it has prevented from getting into the penitentiary.

What Will Be the Effect? That California as a whole has received a most serious setback from the earthquake and fire at San Francisco will not, for a moment, be questioned. Whether the effect will be lasting can not even be prophesized at this time. Judging from experiences of Chicago, Galveston and Baltimore, we have reasonable ground to think that on the ashes of San Francisco will arise a city greater, grander and more beautiful than anything which exists today on this continent.

The spirit of the twentieth century is so pronounced in the blood of the San Francisco Argonauts that nothing can daunt their determination, and the greater their disasters the bolder becomes their fighting prowess. But in estimating the material effect upon the State we must remember that we are dealing with a proposition which does not offer a solution as do many which confront us; that can be explained on natural causes occurring at stated periods, such as storms and other elemental conditions. In this case we have no theory, so to speak, we have cold unexplainable facts and the more difficult of explanation because of lack of definite information which points out the cause.

* * *

Of all the accidents producing death and disaster which overtake us the earthquake is the most dreaded by the human mind. In thinking of it men are not usually governed by reason, but by instinct, by fear and by superstition, the more so because it is absolutely beyond human knowledge or ability to control. We may escape a cyclone or a tornado, as a rule, for they give evidence of their approach in atmospheric conditions before they strike, not so the earthquake. In the glories of the soft summer day it sweeps across a belt of country and cities fall in a moment of time. It is this uncertainty as to time or place where the blow may strike and the awful certainty of catastrophe that follows the well-developed earthquake which makes men such cowards about it. This fear becomes a sentiment which, when once well grounded, never can be eradicated from the mind.

* * *

It may as well be frankly recognized and as frankly said that the effect will be a bad one. It will scare thousands and keep them from emigrating to California, especially to Northern California, which just now was enjoying the highest per cent of Eastern tourist settlement of any section of the State. If San Francisco had been destroyed primarily by a great fire the loss of life might have been greater and the ruin more immense, but its effect upon the popular mind would have been far less.

Until the fact is widely established throughout the length and breadth of the land that Southern California is nearly 500 miles from the scene of the San Francisco horror, that it is not in the same atmospheric vibration, nor of the same geological formation, nor in the seismic belt at all, people will confound the facts and refuse to believe Southern California immune from earthquakes severe enough to destroy its towns as San Francisco was destroyed. For this reason we shall feel the effect of the earthquake all over the State—and for some time.

* * *

The question then presents itself, what is best to do? There is but one thing to do, go ahead and rebuild the waste places on a grander, cleaner, more substantial basis than they were before. Learn from experience to erect stronger, lower blocks on more enduring foundations. Use the best material and build against the accidents of time so far as lays in our power so to do. We may not be able to do this absolutely, but we can do much by profiting by the past.

A hundred years may elapse before another shock will effect this coast. Possibly no other such will ever occur, then why be discouraged? Now is the time for the citizens of California to summon up their fortitude, their strength of mind and their faith in the future. Lisbon was almost totally destroyed by an earthquake infinitely more dreadful than the one we have just passed through, 161 years ago, but it has never been seriously damaged by sesimic shock since.

* * *

No part of the earth appears to be free from the mysterious vibrations. While San Francisco and San Jose were trembling the ground under Moscow, in Russia, was quaking, showing the wide spread character of the disturbance. New York and New Orleans are just as likely to receive a visitation as are the towns on the Pacific Coast. So there is no cause to despair or to feel unnaturally alarmed for the future. Let us go about our business as becomes men and women born to build on the ashes of uncontrollable fire, and while recognizing the misfortune which has overtaken California let us neither be discouraged nor disheartened, but address ourselves with courage, calmness and determination to the task of restoring confidence in our State at home and abroad.

For a time sentiment will play its part; we cannot wholly remedy that, but it is equally certain that common sense and sterling values will play their parts. Our fields are quite as fertile as they were, and our mines as rich. We have more money in our banks than we ever had. Our resources in a dozen ways are vastly greater than a few years ago. Why hesitate? We will build up what has been torn down, and we will do it with such a hearty good will as to advertise our confidence and to compel admiration. We have not suffered more than Charleston suffered, and Charleston has nothing but harmless scars to show for her calamityfl Chicago built up again and outlived her trouble, and San Francisco and her sister towns will do the same, and so will California do the same.

* * *

Outlook for Trade Good. The moderation with which Wall street received the announcement of labor strikes in the coal-producing sections, and the fact that shares of the coal-carrying roads actually advanced instead of declining during the height of the controversy; and the further fact that the California misfortune had no perceptible effect upon Wall street, shows that the trade outlook is particularly strong at this time.

One of the most conservative yet progressive commercial papers of the Middle West, the Denver News, marks the period as highly satisfactory from a business outlook. It says the demand for iron and steel meets the capacity of the manufacturing plants far into the fall, when the assurance of a bumper harvest, the sixth in succession, means a further demand.

Thus far in 1906 railroad earnings have exceeded all records. This was partially due to the open winter, but mainly the results of liberal travel in all directions and a generous flow of goods to the farming sections, where the people are well able to buy.

The wool market is strong in Philadelphia, New York and Boston, which means much to Colorado and the neighboring states and territories at this season of the year, when shearing is about to commence. London is strong on colonial wools, which leads American buyers to meet asking prices in the West. The latter are far in advance of the average, and are well sustained by declining supplies.

A sign of the times at the East is a general advance in wages on the New York, New Haven and Hartford system of railroads, covering much of New England and involving thousands of men. The advance ranges from 10 to 25 cents per day for each man, and concedes the fact that the cost of living is higher than it has been in the past five years. Large cotton mill companies, corporations engaged in the woolen trade and other industrial concerns are also conceding advances in wages. This, bear in mind, is a boon to the retail trade, for increased wage scales are immediately followed by expanding purchases.

On the whole the prospects for the future were never brighter than they are right now.

* * *

Facts About Oklahoma.—The statehood bill which includes Oklahoma and Indian Territory, and which is now before Congress, opens the subject of the value of the properties possessed by these territories. As they are before the public, it may not be amiss to give some of their characteristics, they are interesting.

Oklahoma and the Indian Territory have four times the population of Montana and more than any New England state except Massachusetts.

Oklahoma alone in the election of delegate to congress in 1904 cast 109,145 votes.

Oklahoma's vote was 30,000 in excess of the total combined vote of Nevada, Vermont and Wyoming and was 7,000 more than the vote of Utah in the same election.

Live stock values for Oklahoma and Indian Territory, $91,622,723, or greater than that of the combined states of Idaho, Nevada, Utah and Vermont, and exactly that of North and South Carolina combined.

Farm products of proposed state for 1905, $58,056,112, or $7,000,000 more than those of Montana, Vermont, So. Carolina and Wyoming combined, and within $5,000,000 of those of N. and South Carolina combined.

Oklahoma and Indian Territory have 807 manufacturing establishments, with a capital of $13,661,979. This is nine times that of South Dakota; six times that of North Dakota; over twice the combined states of North Dakota, South Dakota and Nevada; very near the total for Montana; $1,000,000 more than Utah; one-half of Kansas and one-fourth of Colorado.

Oklahoma is not to be considered in the same class with Arizona and New Mexico. She is populated largely with people from the older states. She is not tinctured with Mormonism. Her people are educated, aggressive and thoroughly American. In this she excels Arizona and New Mexico, especially New Mexico, which has in it a type of Dago-Mexicans no nation should admit. Not so with Oklahoma.

* * *

Good Sign.—A good sign of the times is a tendency to quit appropriating so much money for rivers and harbors and giving it to develop rural mail routes and irrigation plants. Much of the money appropriated under the annual rivers and harbors bill is worse than wasted. It is always a log rolling measure, and much of the money is dumped into obscure creeks and imaginary water ways to please Senators and Representatives, who are merely after funds to grease their pathways to place. Rural routes and irrigation plants in the arid regions confer real services to the people who need them and whose upbuilding means the prosperity of the whole country. Everything that helps the farmer helps the nation, and money expended to add more productive land to our cultivatable area is always well expended.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

The Woodland Mail reports pear blight almost eradicated in Yolo county.

Riverside's output of citrus fruits this season will reach about 4000 car loads.

The Lemoore Winery is receiving orders for all of the muscat wines its vineyards will produce.

Fail Oaks is promising an early and abundant crop of peaches though the apricots will be a failure.

The Santa Paula Citrus Fruit Association, a new organization, shipped its third car of lemons this week.

The San Fernando Fruit Growers' Association has equipped its packing house with chemical fire extinguishers.

The Pomona Exchange orange house is now shipping 24 cars per week, and the lemon house about 6 cars.—Times.

A machine fruit wrapper has been invented which has a capacity of 72 oranges a minute. It will wrap a carload of oranges in a day and a half without marring the skin of the fruit.

The official statistics of Riverside County, as published last December, gave the value of horses in the county as follows: Thoroughbred, $3600; standard bred, $38,700; common $268,980.

The Sacramento Union reports that since the close of the cold rainy season the crops in the Samramento valley begin to look very promising fruits also are looking much better than two weeks ago.

The Ventura Free Press says the merchants of Ventura county will greatly miss the apricot crop this year. Men, women and children in the habit of gathering the fruit will not be able to do so this year.

Mr. Humphrey, near Fresno, has set 70 acres of new grapes to "lady fingers," a large white grape with superior shipping qualities and is said to be an excellent fruit for table use. It promises to be a very popular grape in California.

The orchardists in the Pajaro valley are beginning to renew their fight against the Codling moth. They will use tarred rope around the trunk, a few feet from the ground, to prevent the creatures from crawling back after they have been well shaken from the trees.

About three months ago, says the Riverside Press, "Fred Carroll was in one of the Citrus Union Packing houses when they were packing some navels for the foreign trade and he dropped his card into one box. Yesterday he was surprised to receive a letter from the party who bought this box of oranges away off in New Zealand. The fruit was reported to have been received there in excellent condition after its long journey."

AGRICULTURE.

Senator Jones of Garden Grove states that he will have 4000 acres of beets in the Talbert Bottoms.

The planting of asparagus is advocated on large lines in the Imperial Valley by parties familiar with the soil.

J. H. Vail of Fullerton estimates the cabbage crop of Fullerton, La Habra and Orange at a thousand car loads. He is offering $30 per ton.

The Salinas Sugar Factory destroyed by the earthquake will be unable to handle this year's crop which has been valued at $2,000,000.

Over 2000 acres of Government land in the vicinity of Holtville have been filed on within the last three weeks Crops will immediately be planted on this land.

Many of the alfalfa fields in Kings county which were supposed to have been ruined by water are coming out all right and will produce almost their usual tonnage.

The Wagner Bros. are cultivating 4000 acres of potatoes in the Anaheim district. Last year they shipped out 12,000 sacks, and they now have over 2000 sacks to market.

The Department of Agriculture in May gave instructions for the irrigation of 12,000 acres of land in the district of western Kansas known as the Garden City country.

For a period at least, Stockton will become the northern market depot for grain, breadstuffs and live stock. San Francisco will not be able to handle the bulk of this business for a long time.

The Department of Agriculture will establish experiment stations in the Imperial Valley, at Brawley, Imperial, Calexico, Holtville and other points, with a view of studying irrigation methods and possibilities in the Valley.

The statement is made by the Chino Valley Champion that 10,250 acres of beets will provide for the Chino Sugar Factory this year. The factory uses about two thousand tons of lime rock during the season which is now being received at the rate of two tons daily.

The Ventura Free Press states that when the two trustees harvest the potato crop in the Plaza, the merchants of Ventura will be put out of business. Apparently the trustees believe more money can be made from a potato crop than from flowers and shrubs with a gardener to tend them.

The dispatch about the overflow of water in Tulare Lake appears to have been a gross exaggeration and very little damage has been done, in fact, farmers claim they wish the water had run considerably higher as it would have irrigated their lands and greatly assisted agriculture. These ideas are gleaned from the Tulare Register.

LIVE STOCK.

The Imperial Creamery is making 800 pounds of butter per day.

Lemoore is shipping an average of 25 bales of wool to San Francisco every day.

Twenty- four hundred eggs were shipped from Kingsburg one day last week which netted $336. Not bad for one day's work.

Citizens of New Monterey are complaining that the fishermen are violating the law by taking abalones that are under the size prescribed by law. The State law prohibits anyone from taking an abalone which is under 11 inches in circumference.

James French and his son Bert, extensive Western Placer stock dealers, brought into Lincoln this week 70 head of hogs for shipment. One of the porkers, a cross between a Berkshire and Poland China, was probably the largest hog ever raised in that section, and would have been a prize winner at the coming State Fair had its owner seen fit to exhibit it. The big fellow weighed nearly 600 pounds. It cound not be driven into town with the rest of the herd, owing to its great size, and had to be hauled. None of the hogs were grain fed, but averaged 175 pounds, and were sold for 6¾ cents a pound on board cars at Lincoln.

MISCELLANEOUS.

The construction of a new gas plant has been begun at Pomona.

Fresno has already made a start for a 4th of July celebration.

Wm. Smythe of San Diego, is a candidate for Governor of California on the Democratic ticket.

The city council of Pasadena will discontinue sprinkling the city streets after the first day of June.

Stockton claims to be the third most important shipping point in the State and to have 36,000 people.

Los Gatos is to celebrate on May 1st for the completion of the finest and largest concrete bridge in the State.

Oroville and Chico have just had a joint celebration on the occasion of the opening of the electric road between the two cities.

The people of Escondido and San Diego are endeavoring to raise $150,000 for an electric road between Escondido and San Diego.

The U. S. Fish Commission has determined to stock the Bay of Monterey with silver salmon, adding annually to the invoice for the next five years

According to a dispatch from Tokio to the Times, seismographs in the Imperial University show that the San Francisco earthquake reached Japan in 11 minutes.

Oakland is moving in the matter of ornamental street lights. It is proposed to duplicate the lamps used on Broadway and Spring streets in Los Angeles.

The mountain region of Squirrel Canyon has received 54.71 inches of rain this season, and the Redlands Review says it expects between 74 and 75 inches before the close of the season.

The voters of Watsonville defeated the proposition to issue $40,000 of school bonds for needed improvements in the last city election and the Pajaronion is very indignant thereat.

Huntington Beach is discussing the propriety of adopting the wild radish blossoms as the town flower. It grows in such profusion and is never cut, that the News thinks it quite approopriate to adopt it.

The work of procuring iron for guide posts to be erected on desert roads and trails in San Diego county is to be actively engaged in at once. By these signs it is hoped to avert many deaths of prospectors.

Forty acres of choice camping grounds belonging to the Government will become exceedingly popular as a resort for tourists who do not care to spend the summer at the beaches. It is said to be beautiful and healthful and to be well supplied with water.

Many of the most substantial business men and property owners of San Francisco already are in consultation with the architects. While the work of clearing away the debris goes forward a corps of draughtsmen will be busily occupied preparing plans for the new buildings to adorn the city.

In a line with what we do in the way of protecting home industries, Germany has placed a tariff on foreign apples, which went into effect March 1. The indications are that until the San Jose scale is better controlled there will not be as great a quantity of apples as before to export from this country.

There is a movement on foot to call a good roads convention for Southern California at Los Angeles, in September of this year, to organize town good road societies and to be in condition to secure from the next legislature a very much greater appropriation for state road building. By all means this should be done.

The grounds of the University of California are still thronged with large numbers of the 16,000 homeless San Franciscans estimated to be in that city, and on that account college exercises are suspended. It is not certain when studies will be resumed and hundreds of the students have departed for their homes in various parts of the State.

LINER ADVERTISING

LINERS

ANCONA EGGS (FROM PERPETUAL EGG Machines), imported and domestic matings, $2. $3.50 and $5.00. L. L. Viereck, Pres. Ancona Club, Albany, Oregon.

FOR SALE CHEAP, 25 H. P. HOADLEY Portable Steam Engine. New boiler rigged for oil. Everything in first class condition. Enterprise Mfg. Co. San Jose, Cal.

WANTED—WILD TURKEYS EGGS AT $100 00 per setting. Address only The Grace Glory Grounds, Brawley, Calififornia. Wilds of wild Turkeys (acclimated).

BLUE ANDALUSIAN EGGS FOR HATCHING, from three noted strains, $2.50 and $3. Incubator lots $7.50 to $15.00 per 100. Mrs. T. R. Griffith, 3111 Walton avenue, Los Angeles.

FOR SALE, THOROUGHBRED, AND from prize winning Stock, Barred Rocks and White Leghorn Chickens, also eggs for hatching. Mrs. Ossina Low, Glendale, Cal. 'Phone 663.

FOR SALE — 30 HORSE POWER OTTO Gas Engine. Run one season, practically new. Also one 30 horse power White Middleton. Both engines guaranteed in best condition. F. H. Osler. Pomona, Cal.

FRUIT CANNING MACHINERY FOR THE Ranch or Factory, 6sizes, $10 to $225. All appliances, highest award by U. S. Trades Report. Address, W. S. Ritchie, Pacific Coast General Agent, Corona, Cal.

I HAVE 1400 FEET GALVANIZED IRON pipe, suitable for irrgiating. 1000 feet 10-inch and 400 feet 12-inch, all nearly new. Also a 90-foot cow barn fitted with wood stanchions Will be sold cheap. Call at Latin Station on Long Beach Electric line or address R. D. No. 2 Compton, Cal. H. F. Starks.

COLUMBIAN WYANDOTTE EGGS FROM winners; first ckl.; first pullet, New York; first, second, fourth, and sixth pullet; fifth cock at Boston. Eggs from $2.00 to $5.00 sitting. Send for circular. Prof. John Evans & Son, Meshanticut, R. I.

FOR SALE—WHITE MINORCAS EGGS , $1.50 sitting from one of the nicest pens of Wh. Minorcas in Southern California. Lay the most eggs and the largest-whitest eggs of any breed. Call and see them at 547 W 54 St., or address 1004 E. 9th St. Also incubator chicks for sale.

Edison Phonographs and Records at factory prices, delivered free anywhere on receipt of full retail price; largest stock of Edison records west of Rockies; send for circulars. Peter Bacigalupi, 786 Mission St. San Francisco

RANCHES WANTED *For Our Clients*
Burr-Paddon Co., 40 Montgomery St., San Francisco

Live Stock and the Dairy

BY MRS. MINNA. E SHERMAN, FRESNO, CAL.

CROPS FOR THE SILO.

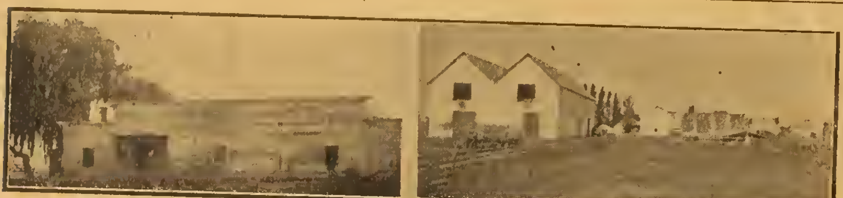
I am going to write about the crops I have been most successful with on the ranch, hoping then some will come back with their experiences. Indian corn is the great silo crop the world over. The following table shows the gain of silage over dry corn fodder. Corn silage has: Dry matter, 63 pounds; ash, 20 pounds; crude protein, 54 pounds; nitrogen free extract, 82 pounds; albuminoid, 24 pounds.

Cured cornfodder has 60 pounds of dry matter, 19 lbs. of ash ;crude protein 49 lbs.; nitrogen free extract, 65 pounds; albuminoids, 30 pounds. The crude fiber of corn silage is 47 pounds and the cured fodder is 56 pounds. The silage shows a higher digestibity of crude fiber and of the albuminoids than the fodder. The difference seems to be that the cows like the succulency of the silage best, for the difference in the actual money gain is greatly in favor of the silage. The additional ether extract in the silage is due to the development in the silage of lactic acid. This is digestable to the cows stomach in a high degree. It seems to whet her appetite the same as celery salt and condiments do ours.

The fact is that with common cows 30 pounds a day of silage and 10 of alfalfa hay will make more milk at less cost than anything that can be fed. When it comes to the superior cow, if she grows thin on this diet, add grain ration up to the limit that she pays for. Try this cheaper way of feeding the stock and see if it does not pay you handsomely. I have been feeding cows heavy grain ration the latter part of the summer and have had the silos filled and have opened them and in a week the milk will be increased and in two weeks nearly doubled, and the cows would stop eating their grain until it was only the heaviest milkers that cared for it at all, and yet the milk was doubled while the cost was reduced two-fifths.

Corn makes the sweetest silage, gives the largest tonnage and is the easiest of all silages to make. It seems impossible that anyone could fail with it if the silo is air tight below and on the sides. The older varieties of corn have given away to some new ones that promise to be superior to any thing yet grown. We found a scarcity of seed corn this year, and are growing King Phillip for the main crop, and have under trial the following varieties: Mosby Prolific, Little Red Cob, and Parrish White. These varieties were chosen on the recommendation of the Kansas Experiment Station. I find that either the Northern Louisiana or Kansas station meets the Fresno condition of soil and heat better than the other stations.

Where land lays so that it can be irrigated from side to side or end to end the corn is planted in rows eight inches apart and with three feet between the rows. These rows are made ridges and the furrow between them is used for irrigation. In preparing the land it is irrigated thoroughly then plowed, furrowed and the corn drilled in. Two cultivations are usually given before the corn tassels, and then when it tassels it is irrigated. We watch the moon for this irrigation, not that we fear its influence, but for the light it affords. The irrigation water is turned in at four o'clock in the afternoon and the water runs until midnight. The full furrows are left and the water turned back into the canal. This is repeated the next night, and as soon as the land is dry enough the corn is either plowed or cultivated to keep the land from baking. While the corn will go through the season without it, this second irrigation makes it grow to six and seven feet and often doubles the tonnage. The planting season is a long one with us—from the first week in April until the 10th of July. To mature a corn crop requires from a hundred to a hundred and twenty-five days. In April the cooler weather holds back the crop, and it takes 125 days, while the July sown corn matures in 100 days. The ordinary crops of silage from corn is about 10 to 20 tons per acre. In the San Joaquin Valley 30 tons is often grown.



The silo is filled with oats and peas. This we grow as a winter crop. The common garden peas of the Niles type of tall growth are preferred. The black Russian oat is the best for silage, but the last two years the seed has been very scarce. The peas are sown broadcast at the rate of 50 pounds to the acre, and then the ground is plowed, turning them under four inches deep. After this the land is harrowed well and in a week the oats are drilled in, or if there is no drill, it can be broadcasted and covered with a brush harrow. The first crop of alfalfa, also, goes into the silo as well as the lawn clippings and the mowing from the roadside of natural grasses and weeds. While there may be some waste to this silage the cost of cleaning up the weeds should be added, and it makes them into good manure instead of allowing them to go to seed. The last cutting of alfalfa goes into the silo as well as the first. This last crop is usually lost by frost, and to have the frosted mass rotting on the alfalfa crowns is not very good for them. The siloing of alfalfa pays in another way. It seems in a few years to take all the foxtail seeds, and this pest grows less and less.

The Silo stands ever ready to have any green stuff put in it. It does not matter if it is half full of some other stuff. All it requires is to remove the surface mould, and put in the new stuff on top. I have had a silo not emptied for four years and when the bottom was finally reached the silage was good. Alfalfa silage is a little harder to make than corn, and I think this is because it is not as mature, so it is put in to heat up slowly and then the second lot added. The advantage of growing an oat and pea crop in the winter and putting it with the first alfalfa crop into the silo is that it is off the land in time to sow corn and then the corn comes up first in the fall for feeding when the cows are fresh. This is fed against a diet of alfalfa hay and rolled barley, with bran for a protein balance, while the

DE LAVAL LEADS IN SEPARATOR IMPROVEMENTS

As the first and original centrifugal cream separators the **DE LAVAL** machines have led in every stage of separator improvement and development. From year to year **DE LAVAL** leadership has been strengthened until today manufacturers of other separators are compelled to constantly create new "talking" points for their machines or else go out of business. First one and then another advertises some new and wonderful "improvement," or else perhaps some asserted to be entirely "new" machine is placed on the market. A close investigation, however, soon discloses the fact that these "improvements" are but schemes to bolster up a failing business and further catch the inexperienced buyer. A few hundred machines are sold on the strength of such claims, but their purpose is soon found out, and then we find the same manufacturers again advertising some other "new" and wonderful but equally worthless "improvement" with which to attract the unwary buyer. Hence it behooves the inexperienced buyer to **investigate well** before selecting a separator. The 1906 **DE LAVAL** machines are even further ahead of all others in mechanical construction than ever before. Their skimming is absolutely complete, their capacities are greater, they turn easier, and their lasting qualities are beyond comparison. A **DE LAVAL** catalogue, gladly sent upon request, will best explain the WHYS and WHEREFORES of **DE LAVAL** superiority to other separators. Send for it to-day.

FOUR CENTS MORE FOR NO. 1 CREAM THAN FOR NO. 2

The creameries of the country have become so convinced of the increased value of thick cream over thin cream that many of them are paying a premium on cream containing 30 per cent or more butter fat over that containing under 30 per cent.

One of the largest buyers of cream in the West, the Hanford Produce Co., of Sioux City, Iowa, issued in January the following statement to its cream shippers.

"We are going to offer a premium of **4 cents per pound** butterfat for what we term No. 1 cream.

FIRST GRADE cream shall consist of all hand separator cream which is delivered at least twice a week in winter and three times per week in summer, this cream to be delivered reasonably sweet and testing **30 per cent or more.**

SECOND GRADE cream shall consist of all hand separator cream delivered in good condition not less than once a week or testing **less than 30 per cent."**

Under these conditions creamery patrons should buy only the cream separator that can skim a heavy cream. The

UNITED STATES CREAM SEPARATOR

can skim a heavier cream than any other and do it **without clogging.** The U. S. has the record of skimming a cream testing **65 per cent.** And remember also that the U. S. holds the **World's Record** for clean skimming.

It gets the most cream and will deliver as heavy a cream as you want.

Write for copy of our fine, new, 1906 separator catalogue. It tells **why** the U. S. can skim the **first grade** cream ; how it made the World's Record for clean skimming and many other things you should know before you put any money into a cream separator. Write for a copy today—do it **now** while you think of it. Ask for catalogue No. 460 and we'll send it **quick.**

VERMONT FARM MACHINE CO.,
Bellows Falls, Vt.

We probably have a selling agent in your vicinity, and if so, will give you his name when we send you the catalogue. It is his business to show you a U. S. Separator if you want to see one. 437

Prompt Delivery Assured California customers from San Francisco warehouse No delays. Address all letters to Bellows Falls, Vt.

alfalfa and oats and peas are in themselves protein, and when we reach that in the silage the cows receive corn meal and oil meal to balance it up. It is a distinct change by making first the protein in the concentrated foods then in the bulky form. With the alfalfa silage the straw from the wheat affords the cows an agreeable roughage. This manurial value of cow feeding is great and that alone we forget in California and buy quantities of commercial fertilizer, making one profit where two are in reach of every fruit grower if he would feed concentrated food to the cows and put money into feed rather than into commercial fertilizers.

ANIMAL FLY KILLER.

Editor Cultivator: Last summer my cows were terribly bothered from flies, so much so that their flow of milk greatly decreased. Please publish in your paper a formula for a fly-killing mixture that can be sprayed on stock to relieve them from the annoyance of flies.—Mrs. G., Tulare.

Try the following mixture. It will relieve horses as well as cows:

Resin, 1½ pounds; laundry soap, 2 cakes; fish oil, half pint; enough water to make three gallons. Dissolve the resin in a solution of soap and water by heating, add the fish oil and the rest of the water. Apply with a brush. If to be used as a spray, add a half pint of kerosene. This mixture will cost from 7 to 8 cents per gallon, and may be used either on calves or cows. One-half pint of this mixture is considered enough for one application for a cow; a calf, of course, would require considerably less. It will be more economical to apply this only to the parts of the animal not reached by the tail. At first it will be necessary to give two or three applications per week, until the outer ends of the hair becomes coated with resin. After that retouch those parts where the resin is rubbed off.

HEAVES.

I have a horse ten years old that is affected with heaves. Can you give treatment that will cure him?—E. B. L., El Centro.

That depends on the length of time that he has been troubled with the disease and the stage of the disease. Carron oil given three times a day in two to four ounce doses will give relief. Feed should be free from dust with but little hay.

RING WORM.

Editor Cultivator: I have a young horse that has gone lame in the hock. It has a swelling about an inch wide almost around the foot. The horse has never been strained, nor overworked. What can I do.—G. E. L., Oakland.

Your horse probably is affected by ring worm. In a recent number of The Cultivator, three weeks ago, this subject was spoken of and a remedy given. Look up that paper and use that remedy.

CARE OF THE COLT.

Editor Cultivator:—I have purchased a colt that was taken from its mother the first day or two. It is seven weeks old. How shall I feed it?—Mrs. E. T., Hynes.

Your question is answered on the first reading page of the Cultivator of April 13. Feed much as you would any young animal—carefully and regularly.

Cream Separators, all sizes, all prices. See O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

ANSWERED ELSEWHERE.

Editor Cultivator:—Will you please publish the recipe that appeared in your columns some months ago for keeping flies and mosquitoes away from horses and cattle? —J. W. H., Brawley.

Read your answer in receipt given this week for animal fly killer.

HEATY MARES.

Editor Cultivator:—I have a mare which gets in heat every sixty days or so. I do not wish to breed her. What shall I do? —R. P. S., San Luis Obispo.

There is nothing to do except to spay her.

SORE NECKS.

Editor Cultivator:—We are troubled with our horses having collar sores. Can you give us a remedy?—J. S. S., El Monte.

Adjust your collars and harness to the shoulders. At night wash with warm water and castile soap and rub dry with soft cloth. If sores have festered apply twice a day a little of a mixture of two ounces of tincture of iodine and four ounces of extract of witch hazel.

DEVELOPING HEIFERS.

Heifer calves should be handled with great care and frequently handled. They should be halter broken and in this way kept gentle. The frequent manipulation of the udder before she freshens will not only cultivate a relation that will cause her to have confidence in her milker, but stimulate development. We consider this very important, then when she freshens she will take kindly to the work she is intended to do and will not be subject to the ordinary ordeal of being broken. The heifer in order to give the best results should drop her first calf when about two years old. This will have a tendency to make her a more persistent milker than when delayed another year. In having a heifer freshen at three years old, we admit that you will have a larger cow, but one that will not be as persistent or copious a milker. You likewise would lose one calf and one year's milk. In the case of the three-year-old, the heifer acquires a tendency to apply her surplus fat instead of in the secretion of milk, a tendency which will cling to her through life, and which would have been avoided by earlier breeding. It must, however, be borne in mind that this only applies to heifers that have been well cared for and have made a vigorous growth.—Western Farmer and Dairyman.

The San Fernando Valley Horse Breeders' Association has shown a stroke of enterprise and secured the imported Clydesdale stallion, Barometer, which will be at service at Toluca and Burbank during this season. Barometer is a magnificent specimen and a prize winner at Glasgow, also at Ohio State Fair and at Kansas City Stock Show. Such an animal should be used to the limit, and will build up California stock.

Look after the brood mares. Keep them healthy and well fed, so that they will be in good condition at foaling time.

Profit in the Poultry Yard

BY MRS. A. BASLEY, HOLLYWOOD, CAL.

INSECT PESTS.

I had not intended writing on insect pests so early in the season, but I have had letters from some of my good sisters in the poultry yard, one especially in San Bernardino county, writes that ticks are very prevalent there in the summer, and are especially troublesome in old wooden buildings. They squeeze in between the boards that are tightly nailed together, she tells me, and some are as thin as a piece of paper, that is before they have partaken of a chicken supper. They bury their heads under the skin of the chicken and remain there, sucking the life blood until they are as large as a navy bean and black with the blood. Hundreds of chickens die from these ticks and it is exceedingly difficult to get rid of them. Two years ago I received letter after letter from Beaumont and Banning all of whom sent me boxes through the mail containing live ticks, enough to stock all Hollywood poultry houses. Some of these ticks I sent on to Professor Cook of Pomona and some to Professor Ward at Berkeley. The latter was at the St. Louis World's Fair, therefore could not reply. Meanwhile, I had written to those in trouble (they were losing half-grown chicks by the hundred) and had advised their spraying their houses with kerosene emulsion and carbolic acid, and, whilst the houses were still wet, fumigating with sulphur.

To do this close every door and window, stop up all cracks that would admit air; burn one pound of sulphur for every one hundred spare feet of floor space in the house. Thus a house 10x10 will require one pound of sulphur; one 10x20 will require two pounds; one 30x10, three pounds and so on.

The sulphur must be burned in iron vessels, which must be set on gravel or sand, so there may be no danger from fire. Into each vessel put a handful of carpenter's shavings saturated with kerosene, and upon these sprinkle the sulphur. Apply a match to the shavings, and hastily leave the house, closing the door. The house should remain closed for five hours, when every door and window should be thrown open. The fumigating may be followed by thoroughly whitewashing the walls inside and outside.

This advice was followed and I received a letter saying, sulphuring, whitewashing and kerosene emulsion spraying does not "feaze" the ticks. I then wrote, try painting or spraying with Lee's Lice Killer, and if that does not succeed try corrosive sublimate.

The reply was that corrosive sublimate "feazed" them, but it was expensive, and it is also a dangerous poison.

Professor Cook wrote that he could not add more to my advice that corrosive sublimate was the best thing to use.

* * *

Mrs. Sherman tells me that at one of the Farmers' and Grangers' conventions about fifty people including the Berkeley professors, discussed this subject, and it was then decided that the best way to fight the ticks was by painting the henneries inside and out with crude petroleum, putting it on freely with a whitewash brush, and then fix a little shelf over the entrance door, on this put a can with a small hole in it and keep the can full of some bland oil, cottonseed preferably. Let the oil drip on to a small curtain of burlap cut into a fringe and so hung that each time a hen or chicken passed through the door the oily curtain would wipe its head off. I hope all our readers will remember this and prepare in this way to fight this enemy. I do not see why the crude petroleum would not be as efficacious in killing chicken ticks as in the destruction of the much-dreaded Texas fever tick, and we know that all cattle coming into this State from Texas are made to pass through a crude oil bath to destroy the ticks, so I strongly advise those who live in a locality where there are ticks to paint their henneries with crude petroleum. I used it for my houses, mixing fifty cents worth of Venetian red with a gallon of common coal oil and adding that to about ten gallons of the crude oil. This made a rich, dark red or chocolate colored paint, which looked well and preserved the wood and I never had any trouble with ticks. This paint lasted for about six years without renewing and looked well when I sold my ranch, and I believe has not been repainted since.

* * *

Next to the ticks come "mites." The red mite is the most common and active of all parasites that attack fowls and even wild birds in this climate. It is very tiny, almost like a grain of sand, and is white or grey in color except when filled with blood, when it is red or almost black. This parasite hides by day in the corners and crevices of buildings, nest, perches, floors, and so forth, where it may be found in clusters.

A poultryman that I know visited one who found the poultry business an utter failure, "Look at that" said the successful man, pointing to a lump of something red on the hennery wall. "Yes," said the failure, "that red stuff oozes out of the Oregon pine." My successful friend took a card out of his pocket and with it scraped off some of the "ooze" and showed the other man that it was alive It was mites, red with the blood of the poor hens. No wonder that they were not "doing well."

At night the individuals composing the clusters scatter themselves over the birds and by pricking the skin, fill themselves with blood. They are injurious not only on account of the blood they draw from the fowls, but because of the itching pain and loss of rest, which frequently will even kill young fowls and sitting hens. When mites are discovered vigorous means should be adopted to get rid of them.

The Iowa State Experiment Station in an interesting bulletin gives a description of the best way of exterminating these litle pests. It was found that the kerosene emulsion, sprayed thoroughly three times on the same day was thoroughly effective; it is made as follows:

KEROSENE EMULSION.

In one gallon of boiling water dissolve one bar of laundry soap, or one pound of soap powder. When the soap is thoroughly dissolved, take it from the fire and add one gallon of kerosene. Churn or stir vigorously until cold. Take one quart of this and to it add ten quarts of water. The ex-

Raise Every Chick

If every Chick hatched last season had reached maturity in 60 to 90 days—hardy, strong and vigorous—how much extra money would you NOW have in the bank?

You could have SAVED these Chicks—every one—if you had used

Purina Poultry Feeds

—for one kind—Purina Chick Feed, is made on purpose to save the lives of little Chicks, and make them grow like weeds. And it DOES IT. Brings up the highest percentage of every hatch EVERY TIME.

The other Purina Feeds MAKE EGGS—make your hens lay all the year 'round—make zero weather eggs EASY. They do this EVERY TIME, and with EVERY HEN, too.

These may sound like "broad statements."

But don't take OUR WORD for it—try it—prove Purina Feeds yourself by feeding them to YOUR hens or chicks at OUR EXPENSE. If the RESULTS don't come, just tie up the bag and write us, and we will return every penny of your money, and tell you what to do with the unused feed. You are not out a cent in making the trial, for we will supply you through your dealer or direct, FREIGHT PAID, and the feed used in testing will cost you nothing.

This is the Money Back line

EGG FOOD A.C.W. IT FILLS THE BILL

Prevent--Don't Cure

It is *cheaper.* In manufacturing and mixing the A. C. W. Chick Food we have kept this in mind, *"an ounce of prevention is worth a pound of cure."* It is very hard, in fact almost impossible, to cure a small chick of bowel trouble, a disease to which young flocks are extremely liable, owing largely to improper food. You will find no bowel troubles in your flock if you feed *A. C. W.* We saw the need of a food containing certain ingredients that prevent this trouble. We use *these ingredients* in our food. Feed *A. C. W.* Chick Food and you will see that what we say here is correct.

We also manufacture special bone meal, blood crystals, etc., for poultry.

Agricultural Chemical Works Office and Factory: 901-907 Macy Street, Los Angeles, Cal.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the GOLD MEDAL at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1604.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A FILCHER, Commissioner.

And Now Comes New Reward for Merit:

Read the following telegram received from the Lewis & Clark Exposition at Portland:

"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

Fourth Carload "Old Trustys"

Special Sale

The Salt Lake Railroad held our car of Old Trusty at the scene of the washouts in Utah for 22 days. The delay has lost us many sales. In order to move this carload quickly while we are settling with the railroad company we will make you very low prices on the Old Trustys, delivered to you anywhere. Investigate, that's all we ask. Never again will you get this price; buy now and save money. Get the catalogue, 124 pages—it's free. Send yonr name, that's all. Free trial to all in your own home with the Old Trusty.

McClanahan Company, 711 So. Main St., Los Angeles, Cal.

periment station advises spraying three time in one day, but I think three times at intervals of three days would be better. I also add one pint of crude carbolic acid to the gallon of kerosene. By using this spray once a month the houses can be kept perfectly free from vermin, and thoroughly disinfected from disease bacteria.

* * *

EDITOR'S QUESTION BOX.

Dead Hen. (Always a Subscriber. R. L., The Palms.) I write to ask you a few questions about a Barred Rock hen I had. As I went in the yard today I noticed she had several bunches on her head under the eyes. I picked her up and upon a close examination I found several hard bunches on her, along on her breast and legs. on both sides of her legs. just a large, hard bunch. I cut her open to see if anything was wrong there, and she looked perfectly healthy, the gizzard was full, had grit and shell also. I also found a bunch of eggs; they were small but quite a bunch of them. I cut one of the hard bunches open and it was yellow in color; looked like it might be fat, but was too hard for that. The hen was in a fair condition but not too fat. I would like very much to know what was the matter with her.

Answer. I have seen a case exactly like what you describe in the flock of a friend of mine about seven years ago. At the time I pronounced it "cancer," but on talking it over with a medical friend he said it was tuberculosis of the skin. My friend never had another case of it and never knew how it originated. Hers was a particularly healthy flock of Plymouth Rocks. I do not think there could be any cure but the hatchet and very deep burial. Your feed is all right. but be careful not to give too much corn to Plymouth Rocks; feed more wheat than corn. Plymouth Rocks easily put on fat instead of laying eggs if fed too wide a ration, that would be with you too great a proportion of corn or cornmeal. Leghorns do well on a wide ration; Plymouth Rocks on a somewhat narrow ration.

* * *

Gummed up Eyes.—(Mrs. E. B. M.) I am a subscriber to the Cultivator and read the poultry items with interest, as I am raising some. I presume you are the one to write to for information.

My early chicks did fine, but my late ones seem to have an affection of the eye. In the morning they can't open them. I rub them with vaseline, and then they seem all right; otherwise lively; the next morning it is the same. Some get over it, but a good many die. Can you tell me what to do for them? Also my later chicks, after about two weeks old, look droopy and blear-eyed. Is that from lice? Now your answer will be greatly appreciated.

Your chicks have what is termed of most cases of this kind is in roupy of nearly cases of this kind is in roupy breeding stock. A slight chill or cold is sufficient to start an epidemic of this in a flock of chicks. if they already possess the inherited tendency from their parents. Sometimes the trouble comes from irritating circumstances, such as airslacked lime, dust, insect powders or kerosene getting into the eyes. The best way to remedy such cases is to remove the cause. Lice and mites will also cause it. Your treatment of greasing the lids gently with a little vaseline is the best you can use. If they are with a hen she undoubtedly is giving them lice, or if they are in a brooder the chances are there are mites in it. Read the article in this Cultivator on mites and for lice take the hen alone, dust her thoroughly with lice powder, and then put her in a box, the bottom of which is painted with fresh "Lee's Lice Killer," put a bit of burlap over the top to keep her in and leave her in the box for three hours. Put a little straw into the bottom so her feathers will not be soiled with the lice killer. Then grease the tops of the chicks heads. I wish that my correspondent would always tell me the breed of the chickens, how raised, whether by hen or incubator and brooder, how fed, housed, etc. It would make it easier for me to correctly diagnose the case by knowing all these little particulars, which seem trival in themselves, but are most important.

* * *

Infertility.—J G. M., Auburndale.) Please tell us through the Cultivator at what age should a Barred Plymouth Rock chicken weigh 1½ pounds? What does it cost to raise chickens up to two months old (being well kept)? Which matures faster, Rocks or Orpington? Mr. White bought a Tom of a thoroughbred turkey raiser for breeding purposes, the seller recommended it to be a very vigorous Tom and all right in every way. It failed to fertilize any eggs. Who should stand the loss (it being a $15 Tom), Mr. White or the seller? When eggs are sold at extra prices for setting, who should stand the loss of infertile eggs.

Answer.—A Barred Rock chick should (if parents were up to standard size) weigh 1½ pounds at from eight to ten weeks old, according to how it is fed. To raise a broiler to that weight costs about 18 to 20 cents, with food at the present prices here, buying everything for feeding.

About the infertile Tom turkey, the seller is honor bound to replace it with another, but there is no law on the subject.

There is no law either about infertile eggs. I always replaced infertile eggs if the fertility was less than 75 per cent, when the eggs were returned to me, and most sellers do that. Some offer a second sitting at half price, others will do nothing, and soon get to be known and lose many customers.

* * *

Dark Comb.—(J. D. E., Downey.) My laying hens are laying well, but I notice during the last few days that combs of several in the flock are turning black and drop down. Will you kindly advise what to do for them? I feed in the morning two-thirds bran, one-third Coulson Egg Food; noon and night whole wheat. About 8 a. m. and 4 p. m. I turn them out on groing alfalfa. Shells always plenty.

Answer.—The comb of a fowl tells quite a little story of what is going on in the organs of the whole body. The dark comb indicates liver trouble, which usually comes from lack of exercise, or feeding a wrongly balanced ration. I do not know what breed you keep and can only suggest that you make your hens scratch more by feeding all the grain in deep (6 or 10 inches deep) litter or straw.

You might give those that have dark comb a dose of castor oil—a teaspoonful—or a dose of Epsom salts.

Prussian Lice Killer

Easy, quick and certain riddance of vermin on poultry and animals.

"I have used the Prussian Lice Killer on my chickens and it is certainly the best I ever used. It is easily applied and it does its work in great shape. I will say to my fellow poultry keepers that they will save time and trouble by using Prussian Lice Killer.
Harry Rutledge, Dyer, Ind.

½ Gallon 50c. 1 Gallon $1.00.

Prussian Lice Powder

The dust method. Sure death to lice, no injury to birds or animals.

"I used a 25c package of the Prussian Lice Powder on 16 head of lousy cattle, and the day after could not find a louse. I consider it the best thing I ever saw." H. V. Spafford, Kelso, N.D.

In 25c and 50c Packages.

Prussian Poultry Food

Guaranteed to produce healthy fowls, more rapid growth, make better layers and to ward off and cure Roup, Gapes, Cholera, etc.

"We have used Prussian Poultry Food for more than two years with great success. We find that it is the proper food for young chicks and just the thing to keep up laying hens."
Arnold Jungman, Poultry Yds, Gladstone, Minn.

In 25c and 50c Pkgs. 25 lb. Pail, $3.50.

LUCK WITH EARLY CHICKENS.

It is the early bird that catches the worm. and it is the early chick that will commence to lay the earliest in the fall and produce the most eggs during the winter. Therefore it is highly important to have the early chick. How to get her is what we are to consider. It is like a puzzle, very simple after you know how.

Some people think that in raising chickens it is all luck or chance, and frequently things do happen to give color to the idea in this as well as in other lines of business. For instance, one man I know of put sixty eggs in his incubator and got no chickens, and from a hen he set, only three. Another man who is a breeder of choice fowls got thirteen chickens only from two hundred eggs this spring, while another person not a breeder and without any special thought or care, got eleven and twelve chickens from every hen set.

It is astonishing sometimes to think how fortunate some people are in this world, who, if not actually born with silver spoons in their mouths, all they have to do is to open their mouths and the gold nuggets or dollars drop right in. But such people, if there are any, are the exception and not the rule. When you come to sift a person's good fortune, great success or great wealth you will find it in most cases, to have been acquired by the use of brains in hard study and hard work.—W. P. A. in Massachusetts Ploughman.

CARE OF YOUNG CHICKS.

In order to have a good, early maturing pullet it is necessary that she get a good start. The first few weeks' care is responsible to a great extent for her success or failure eight months later. Feed, regularity of feeding, cleanliness and plenty of grit and water are all important matters. Chicks should be carefully protected from storms and sudden changes of weather, since these, together with the low vitality of the parent, are responsible for more deaths than is improper food. Poultrymen differ considerably as to when the chick shall have its first food. Good results have been secured when chicks have been permitted to pick a little sand or fine grit from a clean board when about 36 hours old, and, when about 48 hours old, to eat bread crumbs moistened in milk and squeezed dry. After that almost any of the prepared chick foods may be fed about three times a day till the chicks are two or three weeks old, when they will do well with wheat screenings and need not be fed oftener than three times a day. It is advisable to let the chicks have access to green feed at all times. Fine alfalfa hay, cut with an ordinary straw cutter, is excellent, and also makes a good litter to scatter the feed in. It is best, however, to give the last food at night on a clean board, letting the chicks eat all they will and then removing the board. At other times care should be taken that they be kept hungry, or at least sufficiently so to be eager to eat when fresh food is offered them.

SELECTING TURKEY STOCK.

A few plain rules which may be observed to advantage are as follows:

First—Always use as breeders turkey hens over one year old. Be sure they are strong and healthy and vigorous, and of good medium size. In no instance select the smaller ones. Do not strive to have them unnaturally large.

Second—The male may be a yearling or older. Do not imagine that the large overgrown males are the best. Strength, health and vigor, with well proportioned medium size, are the main points of excellence.

Third—Avoid close breeding. New blood is of vital importance to turkeys. Better send a thousand miles for a new male than to risk the chances of inbreeding. Secure one and be assured of his health and vigor prior to the breeding season.—T. F. McGrew.

HOW TO DRESS POULTRY.

Poultry should not be fed for twenty-four hours before killing. A full crop injures the appearance of the dressed bird and is liable to sour and low prices are the result. Poultry should always be killed by bleeding in the mouth, or by opening the veins in the neck. then hang by the feet until they are properly bled. The crop and the intestines should not be removed and the feet and head should be kept on.

Either manner of dressing. by scalding or by dry picking, sell best to shippers, and those scalded best to the home trade. For scalding chickens you should have the water as near boiling point without boiling. Hold by the head and legs, which should be picked dry before scalding. then immerse and lift up and down three times. If the head is immersed it turns the color of the comb and gives the eyes a very shrunken appearance, which leads the buyer to think the

LEO. W. MARDEN, Manager

fowl has been sick. The feathers and pin feathers should then be removed immediately, very carefully and without breaking the skin. They are then "plumped" by dipping ten seconds into hot water and then put immediately into cold water, where they should remain until the animal heat is entirely out, after which they should be hung in a cool place.

To properly dry pick poultry the work should be done before the bodies get cold and while still bleeding. Dry picking is much more easily done while the bodies are warm. The work should be done very carefully, that the skin may not be torn or broken. —H. L. Blanchard, in the Ranch.

FOOD FLAVOR IN EGGS.

S. D. Taft, of Yeomans, Ia., writes The Farmers' Sentinel that he differs with some writers' opinion that what a hen eats in no way affects the flavor of her eggs. "Years ago," he writes, "we had a flock of chickens, mostly Spanish. We also had an abundance of grasshoppers that summer, on which they grew sleek and fat. On this diet they began to lay far better than before. We never saw hens do better. We thought as the hoppers ate our corn our hens might eat the hoppers, so what hoppers they could not catch we caught for them. One day we had company, and to treat them to something nice, served cooked chicken. To our surprise, we could not eat the chicken. It tasted as if we had fried it in rancid grease instead of butter. Not to be outdone in the matter of the dinner, we fried eggs, but as before, we could not eat them, owing to that rank taste."

INCUBATOR RULES.

Have a regular hour for incubator work.

Do not tinker too much with the regulator.

Get the adjustment right and keep it so.

Be sure vour hands are clean when handling eggs.

Do not disturb the eggs after the evening of the eighteenth day.

There is no one thing that will start a hen to laying and keep her at it like a fresh made nest now and then. Place the nests in a part of the house where they will be as dark and quiet as possible. Business hens do not like to have their nests molested.

It is a good idea to provide shade for poultry, in fact, essential in California. If you have not already planted trees for this purpose make preparations to set out as many as possible now. It is not too late. Secure those that are best suited to your locality and keep in mind that it is well to plant the trees so that they will be ornamental as well as useful.

Eggs.—It is well known by most chicken fanciers that unfertilized eggs keep better than fertilized. How many can tell, if you take the rooster away from the flock for how many days will the eggs produced prove fertile? Eleven days according to the latest

---

If a chick is allowed to stop growing it will take a long time to get it started again.

"Don't put all your eggs in one basket"—put most of them in an incubator at this time of year.

Mate the hens with a full-blooded cock of merit. A trap-nested bird is the most valuable. Be sure he has no physical deformities.

TO GET FANCY PRICES.

In a Cornell bulletin on the subject of marketing eggs among the conditions named in order to get fancy prices are eggs of highest quality, which can only be obtained with skill and care from pure bred fowls, spotless clean eggs, and therefore as soon as gathered they should be taken to a cool place and covered with a clean cloth; wiped, never washed, when dusty, because washing removes the natural secretion which covers the shell and: ,

"In order to secure a fancy egg market the supply of eggs must be continuosus. The poultryman who can not get a reasonable number of eggs every month in the year can not hope to secure the highest paying trade. Consumers, large hotels and dealers are lookers for the man who can furnish them with a definite, reasonable number of eggs during October, November and December. To such a one they will pay the highest prices, and they will take his eggs all the year round, in order to have the privilege of getting them when eggs cannot be obtained elsewhere at any price. These rich customers will not consider for a moment dealing with a producer who cannot supply eggs during the three months mentioned. Therefore, one of the first requisites in working up a high class trade is to be able to deliver the products regularly and continuously. Unless this can be done one cannot hope to secure much, if anything, above the regular market price throughout the year."

OVER-FEEDING

One of the most important subjects that confronts the poultryman today, especially the beginner, is the caring writes Mrs. Wilcox to the Northestern Agriculturist. Chicks normally hatched and given almost any kind of care will live and seem to thrive for the first week, then the trouble begins. The critical period in the chick's life is the first two weeks. Starting the chicks right is half the battle. When they have arrived at 3 or 4 weeks' old they have nearly passed the dangers of chickendom.

One great danger is over feeding. The young chicks require but little food for the first few days of their life. Their digestive organs are not strong and by over feeding they are over taxed and bowel trouble results. Just before leaving the shell the chick draws into the body the whole of the unabsorbed yolk of the egg. This is its food before and after leaving the shell. It must be exactly right, as nature never errs. It is the food nature provided to sustain life until the chick is strong enough to take other food. Chicks should not be fed until 48 hours old. If fed too soon or too much the yolk of the egg which it took into the body before leaving the shell will not be drawn upon; it will remain unabsorbed and in time decompose, causing death. The greater number of chicks which die of bowel trouble do so at about a week or ten days of age. If you will open one of them nine cases out of ten you will find decomposed yolk in the yolk sack. Improperly feeding chicks especially for the first two weeks unmakes more would be poultrymen than any other one thing in the whole business.

THE LAWN AND ITS CARE.

Continued from first page.

toothed rake or a specially constructed harrow; the latter for the purpose of accomplishing on a large scale the results obtained by the use of a steel hand rake on small areas. This treatment will produce a suitable seed bed for the reception of the fine seeds of the grasses.

After the seed bed has been thoroughly and carefully prepared and the grass seed scattered in appropriate quantities, according to the kind used, the surface should be given a careful raking or rolling if the area is dry. If showers have been frequent, raking after the seed has been sown will suffice until after the grass has reached a height sufficient to be clipped by a lawn mower. Prior to clipping the grass with a lawn mower, if the ground was not rolled after seeding, a heavy lawn roller should be passed over the surface in order to make it as smooth as possible. After the grass has an opportunity to become erect it should then be clipped with a mower.

HOW CHURNING BRINGS THE BUTTER

In a book on the dairy industry in New Zealand is to be found an account of what is called "The Theory of Churning," which brings forward several different theories on how and why churning brings the butter. We reproduce it for the information of our readers, and as a part of the history of the development of the dairy industry.

Although the theory is discussed from what might be called the scientfic standpont, yet there s a good deal of practical business sense in connection therewith; and we trust every reader will take the time to study it thoroughly, so that if ever called upon, he can explain the why and wherefore of churning.

We quote as follows: Several theories have been put forward to account for the phenomenon of churning. Thus, Fleischman holds the view that the globules of fat in milk are in a superfused condition and that churning is simply the phenomenon of solidification; with the recognition of the fact that the globules are solid at low temperature this view is untenable. Soxhlet holds that churning consists in the rupture of the solid membrane, which he believes exists round the fat globules; as the existence of such a membrane appears hypothetical this view cannot be accepted. Storch attributes churning to the gradual rubbing off of a semi-solid membrane of "mucoid substance," and this hypothesis has much to recommend it; the whole of the evidence points to the existence of a layer, which is not solid, round the fat globules. As previously stated, the author cannot reconcile Storch's theory that this layer consists of "mucoid substances" with known facts; but it appears very highly probable that there is a layer, the composition of which is for the present purposes immaterial, round each fat globule. As it is improbable that this layer is elastic, the effect of the impact of one fat globule on another will be to squeeze out the layers between them, and bring the globules within the sphere of each other's attraction. In this way nuclei will be formed, which will, on continued churning, increase in size; as the nuclei get larger and larger, the resistance, owing to fluid friction on their surfaces, will gradually bear a smaller and smaller proportion to the force tending to bring them to the surface, and at a given moment, the butter will "come." This theory is in accord with all the known facts. By microscopical examination of cream during churning the formation of nuclei of irregularly shaped masses of fat globules is noticed. As an irregular mass will occupy a greater apparent volume than a sphere, the transformation of spherical globules into irregular nuclei should be attended with the thickening of the cream, which is in accord with the facts; as the nuclei increase in size the layer condensed by surface energy round them will rapidly become less, so that the cream will gradually decrease in thickness; this decrease in thickness of the cream should take place later than the increase mentioned above, which is also the case.

When the butter is taken from the churn it is in fine grains, which are the nuclei referred to. On working, the fat globules are still closer to each other, and the butter is formed into a nearly homogeneous mass; small amounts of liquid are, however, left distributed throughout the mass, and as these liquid globules are very small and contained in a medium which, though solid, is still viscous, they are by surface energy transformed into spheres. The microscopical examination of butter shows a number of spherical globules of aqueous liquid in a nearly homogeneous medium, consisting of fat; there are, however, many fat globules left, which, by careful examination with little light (best by dark stage illumination), can be made out. The whole of the globules, usually seen, which are of all sizes, consist of aqueous liquids; in many cases where the globules are of sufficient size for the surface energy to become small, they cease to be spherical.

The reason that butter always does, and must, contain water is that the aqueous liquid present is finely divided, and assumes a spherical condition. It is impossible by pressure from the outside to remove small spheres from a homogeneous medium. It appears certain, from the experiments of Storch on the density of butter, that the density of the fat is the same as that af butter fat in the solid state. It is, therefore, solid in butter. This view is nearly universally accepted. Vieth, however, holds that it is liquid, because all the globules which are visible are spherical; it appears probable that he has overlooked the fact, only recently pointed out by Storch, that all the globules visible by the usual microscopical examinations are water globules.

With the recognition of the fact that butter is an approximately homogeneous fatty substance, the reason for its change of consistency of alteration of temperature at once becomes apparent. To churn butter of the right consistency it is necessary that the fat in the cream shall be of that consistency. As pointed out in Appendix A, the fat in cream which has been warmed very slowly solidifies. If the cream has been kept at a high temperature, as in summer, it is necessary to churn at a lower temperature, than if the cream has been kept at a lower temperature, as the effect on the consistency of the fat of cream of cooling for a long time at a fairly low temperature is the same as that of cooling for a shorter time at a lower temperature.

LATEST EGG-LAYING CONTEST

The latest egg-laying contest is that just concluded at the Kansas Experiment Station. The leading breeds were represented with a pen of a male and six pullets. The methods were those ordinarily employed, the idea being to bring out comparative results such as might be obtained by an experienced poultryman. The usual mixtures of green and soft feed were given, also vegetable food, oyster shells, grit and meat meal, but no fresh meat, pepper, patent foods or other stimulants.

During the twelve months of the contest the pen of White Leghorns laid 885 eggs; the Rose Comb White Leghorns laid 828, laying, however, a larger proportion of their eggs in the winter than the single comb pen. The American Reds laid 820 eggs and showed the best winter egg record. The White Wyandottes laid 779, the Buff Wyandottes 764, Barred Plymouth Rocks were not fairly represented, the females being yearlings, while those of the other breeds were pullets. The Brahamas were, as usual, slow in developing, but continued to lay well except in the spring. Probably for a longer time their relative showing would have been better.—Indianapolis News.

POULTRY RAISING ON THE FARM.

The raising of poultry is a business that has not yet received from the public the attention it deserves. Nearly every branch of trade is over supplied with workmen. The business of poultry raising opens a promising field for all who possess ambition and industry. The cost of raising poultry is small when compared with the high prices they command. For the small amount of money required I know of no other legitimate business that will bring quicker and better returns than poultry. It is a sure business when one understands it, because you can generally control the conditions which assures success if you will but attend to it. There is money in poultry and will be for years to come. The fact that so many fail to make a "go of it" is what makes it profitable. The products of the poultry represent so much cash. The demand is greater than the supply and so long as this is so the careful hard working man or woman will reap the results, while the indifferent will fail. Out of the same soil wheat and tares are produced. One presses forward to a definite aim, the other drifts here and there on the waves of circumstances. So our poultry operations may prove successes or failures in proportion to the amount of zeal and energy put forth.

At Fresno, say the papers, dried fruit is soaring. The price of peaches has gone to 8 cents a pound, which is believed to be the record up to this time in California.

At 8 cents for dried fruit the grower is assured of a return of from $350 to $400 an acre from his land.

There is little hold-over stock. An estimate made the past week is fifty carloads in all for the entire San Joaquin valley.

About Armona many orchards have been partially put out of business as far as this season is concerned, on account of the severe storms.

THE BOSS LADDER

We have been making the Boss Fruit Ladder since 1895, and thousands of them are now in use. They are lighter, stronger and stiffer than any other make. A 10-ft. ladder weighs 25 lbs. so that girls and boys can handle them. Each step is braced with four wire braces. We will ship one or more to any S. P. R. R. Station in California, on receipt of price—30 cents per foot and prepay the freight.

Driver, Aber & Co., San Leandro, Cal.

Portable Buldings

Made in all sizes and for all purposes. Cut shows No. 48, 4-Room House, size 12 feet 4 5-8 inches wide, 24 feet 4 5-8 inches long, height of walls 7 8 or 9 feet.
Send for Our Catalogue, which gives photographs, prices and weights of other buildings.

Queries and Replies

DREAD ANAHEIM DISEASE.

Editor Cultivator:—I have noticed some articles lately about the so-called dread Anaheim disease of the vine. As I am growing grapes in an infested district, I would like to give my theory about the disease and a probable remedy. My theory about the disease is this, that it works in the sap of the vine, passing down through the roots and out through the soil, so that the neighboring vines are affected, or else it is contagious by cast off spores blown about by the wind. But I favor most the first definition. We all know that when the disease gets a foothold it rapidly spreads until the whole vineyard is gone.

Now for the remedy. The disease works at all times of the year, so be well acquainted with your vineyard so that you will detect every affected vine, then go right after it with the shovel and dig it out root and branch. This remedy will not cost the vineyardist anything to try and it may be worth thousands of dollars to the State.

Here are a few of my observations: About four years ago several vineyards in my neighborhood began to be effected. The owners did not at once remove the diseased vines, so today these vineyards are a total wreck. I have been practicing this simple remedy for many years, and I still have seven acres of fine healthy vines of many varieties with only two or three vacancies in the field. Last year I lost six vines. This year two. A sick vine is worse than a sick chicken, because the chicken will sometimes fool you and get well, but a vine never.—G. D. Lee, Compton.

FEDERAL IRRIGATION.

Editor Cultivator:—Of the several different projects of Government irrigation mentioned in the Cultivator, which do you think the best location, climate and market facilities taken into consideration? When and how can such lands be taken up? How soon will they be completed, and in what order? Are there any provisions preventing "land grabbers" from taking the choice lands? Will you kindly answer in Cultivator or by letter?—A. R. S., Beaumont.

(The above letter was forwarded to the office of Mr. J. B. Lippincott, Government Engineer, with a request for information in answer to this and various other inquiries along similar lines. His reply is given in full below:)

Editor Cultivator:—I wish to acknowledge receipt of your favor of the 11th, in which you refer to me a letter from A. R. S., Beaumont, Cal., asking for information concerning Federal irrigation projects.

On the Yuma project, water will not be ready for delivery for twelve months. It would be impossible to begin extensive irrigation in that district, therefore, for a year. Lands in that district can now be obtained for very reasonable prices, and there is a demand for labor in connection with the construction of the irrigation works. For information concerning the lands and business opportunities, it would be proper to communicate with the Yuma Water Users' Association, which is the organization that is contracting with the Secretary of the Interior for the delivery of the water.

On the Klamath project, two canals are now being purchased that are furnishing water for the irrigation of about 10,000 acres of land. Lands can be purchased at reasonable figures under these canals at the present time. The water from the new Government ditches will not be available for irrigation for twelve months.

On both the Klamath and Yuma projects, the public lands that will be irrigated at an early date are already filed upon, although there remains on both projects large areas of public lands which will be available for entry at some time in the future.

For information concerning the Klamath project, I would advise that your patrons correspond with the Klamath Water Users' Association at Klamath Falls, Oregon. These water users' associations are organizations for the purpose of dealing with the Federal Government and we usually turn over correspondence to them from parties who are making inquiries looking toward settlement of the land.

Yours very truly,
J. B. LIPPINCOTT,
Supervising Engineer.

A CORRECTION.

In our issue of the 13th instant, under the head of "California Pippins," a paragraph was left out of Prof. Hilgard's letter in the copy sent to this office. This has been forwarded with a request to publish, and the same follows herewith:

"There should also be tried alongside of the Thomas phosphate a good superphosphate. The superphosphate however, had also better be put in deep, because in the Watsonville soils it would be apt to stay within the first few inches of the surface."

THE BEST RHUBARB.

C. H. P., San Luis Obispo. We believe the Crimson Winter Rhubarb to be the best for California, more especially the southern part of the State. You seem to have left out a part of your second query, which reads, "and is a budded tree as good as a grafted one?" It makes some difference what sort of a tree it is. As a rule, however, the grafted is best, but costs more.

The Analy Standard has the following item on improvement of its public roads: Supervisor J. G. Armstrong has placed 1400 tons of crushed rock on the roads in the immediate vicinity of Sebastopol during the past three years, and will have put 2000 tons by the close of this season. Besides this he has put $3500 worth of oil on the roads leading out from Sebastopol during the same three years, and will have put $5000 by the coming fall.

Word has reached Vallejo that the $3,000,000 bonds of the San Francisco, Vallejo and Vaca Valley Electric Railroad Company have been sold, and that arrangements are about complete for the commencement of construction work on the branch road between Vallejo and Benicia right away.

Congressman McKinlay's bill allowing the waters of the Sacramento river to be diverted for irrigation purposes has been passed. It is estimated that over 200,000 acres of the most fertile land in the Sacramento Valley will be supplied with enough water to make it produce immense crops of alfalfa and beets.

Several large auction sales of draft and wagon horses have been held in San Francisco during the past month, and the prices obtained were far in excess of those expected by the shippers. This goes to show that the price for draft horses is rising. The same conditions obtain in all the Eastern stock markets.

One grower in the southern part of the state was recently offered $8,000 for the crop of Valencias on six acres of land—and refused the offer. There are a good many such cases throughout the citrus belt.

There are now 2500 hogs on Mr. McKim's ranch east of Imperial.—Standard.

Redlands has shipped to date 7,518 cars of oranges and 1427 cars of lemons. The orange shipments are now 2402 in arrears of last year. The Citrograph says: "The prices will remain high if everybody does not get crazy to ship all at once."

The Western Gas and Power Co., formerly 212 Sansome Street, San Francisco, are now located at 1846 7th St., Oakland, where they are prepared to transact business as usual. Their advertisement appears in the Cultivator under the heading of "Cheapest Home Gas for Lighting, Heating and Cooking." Our readers will secure any information desired by writing for "Red" catalog.

The G. W. Price Pump Co. of San Francisco, whose shops were totally destroyed in the great fire, have opened a temporary office at 105 8th St., Oakland. They were fortunate in having a large stock of goods at Los Angeles and Visalia from which orders can be filled with promptness. A site has already been selected for their new works, and they will be in full running order very soon. Their advertisement in the Cultivator shows their old address in San Francisco, as their announcement was received too late to make the correction.

REMEMBER.

We cannot answer questions the same week they are received. Often we have to send to outside parties for data which takes some days to receive.—Editor.

A WOMAN'S CLUB.

What is a woman's club? A meeting ground
For those of purpose great and broad and strong
Whose aim is toward the stars; who ever long
To make the patient, listening world resound
With sweeter music, purer, nobler tones.
A place where kindly, helpful words are said
And kindlier deeds are done; where hearts are fed;
Where wealth of brain for poverty atones,
And hand grasps hand, and soul finds touch with soul.
Where victors in the race for fame and power
Look backward even in their triumph hour
To beckon others toward the shining goal.

What is woman's club? The fabric of a dream
Touched with an altar coal and made alive,
Instinct with hope for those who toil and strive
And wait to catch that joyous day's first gleam
That ushers in a better, freer age.
When right for one shall be for all the right;
When all who meet in life's recoil and fight
The war for right and truth shall bravely wage.
—Helen M. Winslow, in Club Member

WHY IS THE WOMAN'S CLUB VALUABLE.

Editor Cultivator: You ask me why the Woman's Club is valuable for women. I can better speak for myself from a personal point of view. When I first became a member of our club I had had no experience what ever in doing things in a public way, nor had I seen much of women in any way but domestic and socially I did not know a woman could have ideas on public matters and express them. I supposed her duty lay wholly in housework and caring for the family, sewing, baking and the like. When I was induced to join our club it was the about a year old with some fifty members or more. I was amazed to see women stand up and talk in public about matters other than domestic. I soon found that they could discuss public quetions, civic topics, tell how to beautify the home in a hundred ways I had not before dreamed of in my little world of ac ton. I became inerested in the meetings. I bought papers and books on subjects to be treated by the ladies at our meetings, and found them intensely interesting. By and by I was appoined to read a paper on "roses." I wrote to a practical rose grower for some facts and he gave them to me. With these and others I acquired and by studying different varieties growing in my garden and in the gardens of my neighbors, I got together quite an array of interesting data which I proceeded to write down and read. Well, I learned more about the rose family in California thanI supposed was to be known, and I also found that I had interested my fellow members, for they talked about my paper and thought it real good. Of course I was pleased and had gained a little knowledge from personal effort. Ever since I have been studying roses and other flowers and my household duties haven't suffered in the least by my endeavors.

I found that I could spend an hour or so every week looking up questions at home for discussion at the club, and by so doing rest myself from work and feel in much better mood physically to do my work. My experience is the experience of every woman who goes into the club with a view of helping others and at the same time helping herself. I think the club is helpful to women in many ways and for many reasons a few are mentioned from personal experience.

First it takes a woman out of her work-a-day life and gives her new ideas. It broadens her mind. She gains helpful suggestions from others. She finds there is a place in the world for her outside of her house.

Second, it furnishes a medium for better social acquaintance with her neighbors which she can not get in any other way. If she hasn't this medium only the church is left, and you know a woman in a small town doesn't always go to church every Sunday and she may not see her neighbors once a monht, and then only to pass the time of day, for it is hurry Sunday morning to church and hurry home to get dinner and the opportunity to visit much is out of the question. At the club there is more time—and then only women are there to participate.

Third, it is helpful in that it gives woman a better idea of her sex; It inspires her with confidence in woman's work and her ability to be helpful outside the confines of her home.

I have received valuable suggestions as to certain things I may do for my boy and girl, for my husband, how I may make my home attractive and how I may interest my husband and children in our home that I could not have gained in any other avenue of practical work.

I do not find it necessary to slight my home life and my wifely duties to belong to our woman's club. Socially mentally and physically, it has been helpful to me. I could give you other reasons for my faith, but you ask me to me brief.—Mrs. R. B. J., Ventura.

THE RIGHT MAN.

Boss—"I want a man to take charge of the information bureau; he must be a man that can answer any amount of questions and not lose his head."

Applicant—"Well, I'm the father of eight children."

She—You are depressed. I didn't know you cared so much for your uncle.

He—I didn't; but I was the means of keeping him in an insane asylum the last year of his life and now that he has left me all his money I've got to proved that he was of sound mind. —Tit-Bits.

Hicks—He's very wealthy.

Mrs. Hicks—Yes, and very stingy and economical.

Hicks—Don't be sure of that. You can't judge a man by his clothes.

Mrs. Hicks—I don't. I'm judging him by his wife's clothes.—Philadelphia Ledger.

HIS FATHER KNEW,

A college student, in rendering to his father an account of his term expenses, inserted: "To charity, $30." His father wrote back: "I fear charity covers a multitude of sins."

THE WIFE'S RIGHT.

Editor Cultivator:—I am told that the laws of California are such that a second wife has no right to her husband's property unless she can prove that she has by her own hard labor helped him acquire what he possesses, and that she can lay no claims on any part of anything he owned when or before she became his wife unless he has left her something in a will or testament. What I want to know is am I rightly informed?—L. A., Santa Ana.

If the property was owned by you before marriage your wife has no community interest in it. If you die without a will she will become your heir unless you have children by the former wife, in which case she can only come into one-half the estate. Best way is to execute a will or consult some reliable attorney.

NOW THE LADIES.

The Cultivator will be glad to publish helpful hints, tested receipts, and household suggestions from the lady readers. Write not over 500 words, on one side of the paper, and sign your name to your communication, not to be published, but as a reference.

Young ladies, misses, matrons and all invited to give us their ideas on household topics. Club women are requested to suggest thoughts along civic improvement lines.

Lettuce and radishes are two crops that may be grown every month in the year. They have "all seasons for their own."

COLONIST RATES TO CALIFORNIA

Will be in effect every day, Feb. 15 to April 7, and Sept. 15 to Oct. 31, 1906, from all points in the east and south.

Following are a few:

Chicago... $33.00
St. Louis... 30.00
Galveston ... 26.45
Kansas City & Leavenworth $25.00
St. Joseph & Atchison... 25.00
Council Bluffs & Omaha... 25.00
Dallas, Houston and Fort Worth... 25.00
Nearly all points in Kansas. Oklahoma and Indian Territory... 25.00

Colonist rates are also in effect from all points east of Chicago and south of the Ohio river.

Santa Fe Agents in California will take deposits of money to cover price of tickets, which will be promptly furnished to passengers at any point from which these rates are in effect.

California illustrated literature mailed free to any address or may be had from Santa Fe representatives.

Tourist Sleeping Car Lines

Colonist tickets are honored in tourist sleeping cars which run via the Santa Fe to Los Angeles and San Francisco.

Hints for the Cook

PUMPKIN PIE.

To each pie add 1 level teaspoon cornstarch. Use plenty of spices and no one will ever guess it is minus eggs.

* * *

CREAM PUMPKIN PIE.

Mixing 3 heaping teaspoons sifted pumpkin with 1 heaping tablespoon flour, and add 3 cups rich milk. Season to suit taste and bake in slow even.—Mrs. J. W.

* * *

PLAIN CAKE.

Cream ¾ cup sugar with butter size of an egg. Add 1 cup buttermilk and sift in 1 teaspoon each of soda and baking powder with 2 cups flour. Flavor to suit taste, beat well and bake slowly 1 hour.—Mrs. J. W.

* * *

BROWN CAKE.

Cream 1 cup sugar and ¼ cup butter, add 1 cup buttermilk and 2 cups flour in which has been mixed 1 teaspoon each of cinnamon and soda and ½ teaspoon cloves.—Mrs. H. S. M.

* * *

CHEAP CAKE.

To 1 cup of molasses add 4 tablespoons pork fat, 1 tablespoon ginger, 1 tablespoon soda dissolved in 1 cup boiling water, and flour to thicken to a stiff batter.

* * *

MARBLE CAKE.

Light part: 1 cup sugar, ½ cup butter, ½ cup sweet milk, whites of 3 eggs, 2 cups flour, 2 teaspoons baking powder, flavoring.

Dark part: ½ cup brown sugar, ¼ cup butter, ¼cup sweet milk, yolks of 3 eggs, ½ cup molasses, ½ teaspoon each cinnamon, cloves allspice and nutmeg, ½ cup raisins, 2 cups flour, 2 teaspoons baking powder. This recipe never fails. The dark part makes a fine fruit cake by adding fruit. The light part also is nice frosted with cocoanut.—Clara S.

* * *

ORANGE WINE.

One dozen oranges to a gallon of water and 3 pounds of sugar. Pare the oranges thin and take off the white pith. Mash well and then put all the juice, oranges and water together. Let it stand for 24 hours, then strain it off and pour into a barrel with the sugar, half the peel.—O., Duarte.

* * *

When it is not possible to have ice meat may be kept fresh for several days through very hot weather by immersing it in freshly soured milk. Put the meat into a crock or crockery bowl, cover entirely with the milk and set in a cool place. Change the milk at intervals of twelve hours.

Chewing gum in moderation is recommended by dentists, for the teeth. It is also advised by doctors to be practiced for half an hour after each meal, to assist weak and faulty digestion. This applies to dyspeptics and not to school children who are not generally troubled with weak stomachs, and are often accused of being able to digest ten penny nails.

The practice of keeping the jaws wagging continuously does more harm than good.

Those who have not planted their rose bushes should do so at once. They will get a much better start now than if the start is delayed until hot weather.

IMPROVE RURAL SCHOOL GROUNDS.

In our State it is too often the rule that the plainest, most barren and least ornamental spot in each community is the district school. This is a sad state of affairs. In the first rush of settlement, when there were so many things to do, or during "boom days," there was some excuse for it, but at the present time there is no excuse for it whatever. The agricultural department has seen the need and has published a bulletin on the planting of trees in school house grounds and another on school gardens.

The country school boards should offer prizes of various kinds to the children showing the best and most tasteful improvements in the school grounds, in the way of planting trees, vines, shrubs, rose bushes and flowers, the laying out of paths, etc. It is time to be doing these things. In fifty years more the West should look like they had been finished up by loving and painstaking hands.

There has been a great deal of talk lately in regard to the teaching of agriculture and horticulture in the rural schools. Great good could be accomplished in this way if there were teachers qualified for the work, but the so-called normal schools turn out too many drilled teachers, who do little in the real teaching of nature. If the country school teachers could all be given a short course in agriculture and horticulture we might after a while have men and women prepared to take up the work in an elementary way in the rural schools. The short courses at the University of California come in the summer months when the teachers are having their vacation. These might be made a strong force in the progress of nature teaching. With teachers enthused for the ork, there would soon come some application of what they have learned in the planting and beautifying of the school grounds. There is nothing like the actual work in planting trees and flowers and caring for them to make children fond of nature and her products, and there is nothing better calculated to drive the young people from the farm than the comfortless and ugly schoolhouses and their ill-kept surroundings. Getting the young people inerested in plant life will be apt to draw them to the Farmers' Institutes, and the Institutes will never accomplish what they should in the education of the farmer till they catch him young enough.

THE NATURE OF YEAST.

Yeast is a plant. It belongs to a class known to botanists as fungi. The particular genus of plants to which yeast belongs is saccharomyces, so named because the members of this genus live mostly in saccharine or sugar solutions, where they convert sugar into alcohol. Yeast plants are a little higher in the scale of development than bacteria. They are unicellular and reproduce by budding. Bacteria reproduce mostly by simple division. It is quite possible by watching active yeast cells under the microscope to observe the budding process. As soon as yeast cells are immersed in a suitable medium they begin to expand and grow. After a time the round yeast cells become slightly elongated through the formation of small protuberances at one end. This grows until a neck is formed by a contraction of the cell wall. If the growth continues the strangulation referred to proceeds until the cell wall completely shuts off the protuberance, which then constitutes a new daughter cell attached to the mother plant. This is the reproduction process known as budding.

One yeast cell is capable of giving off several buds in succession, but after a time its reproductive energy is exhausted and the cells break up. The daughter cells give rise to new cells, and thus the multiplication continues very rapidly. Simultaneous with the progress of this growth and development, sugar is being decomposed and alcohol and carbon dioxide formed. It is this carbon dioxide which is given off as a result of the growth of yeast added to bread or other substances which causes our bread to rise.

The most favorable temperature for the growth of yeast lies between 77 and 95 degrees Fahrenheit. Between these point yeast flourishes and grows well. At temperatures lower than 77 degrees the growth proceeds, but not so rapidly. At a temperature as low as 49.6 degrees Fahrenheit the growth of yeast is entirely arrested. The vitality of the cell, however, is not injured by such a temperature and growth will begin immediately upon putting it under favorable conditions. Actual freezing does not destroy the yeast cells, provided they do not become ruptured or injured. A temperature above 95 degrees Fahrenheit weakens yeast sells and a temperature of 140 degrees causes coagulation of their protein, resulting in their destruction.—Farm Science.

Congress has voted $20,000 for the immediate use for the re-survey of the Imperial Valley.

An Instance.

"Who is that little old woman who applied for a niche in the Hall of Fame and was refused?"

"Don't know, but she seems familiar."

"The committee said she was not entitled to the honor because her work was nonsense."

"Oh, I know her now—it's Mother Goose."

An odd church is that in the redwood forest near San Jose. It is maintained by the miners, and has a miner as minister. It is built in one of the hollow trees and accommodates a congregation of twenty-five, with space for a recess chapel, which contains a small organ.

OUR WHEAT CROPS.

An American professor of one of our agricultural colleges, speaking at a banquet in Europe about America and her advantages, had a Scotchman call his attention to the fact that America with her great agricultural institutions and her advantages of rich soil was now producing a yield of wheat the average of which was only thirteen bushels to the acre, while in England the average was twenty-nine. It is a deplorable fact that America is not doing its best in the production of any grain product. America once held first place in the production of wheat, but now holds fourth place. We have millions of worn out acres and as yet many have not learned to farm. Although a corn country, we are not coming up to our possibilities in this line, or any ways near it.

LOS ANGELES PRODUCE EXCHANGE

A visit to the Produce Exchange of Los Angeles, at the junction of Central and Towne avenues, would prove a pleasant and instructive surprise to a majority of those interested in our local produce markets. Few are aware of the magnitude of the dealings in staple produce; nor could they be before the reorganization of the local exchange.

Prices of all products are published on the boards daily as well as receipts by rail, steamer and team. A system of collection of general information regarding the market products of Southern California is carried on by the secretary, J. Mills Davies, who has had wide experience in the work of the Produce Exchange, having been secretary of the first organization and upon the re-organization of the exchange last November, he was again selected for this position.

This fruit and produce business is growing so rapidly that it is believed it vill eventually become the leading industry of the Southwest and will add millions of wealth to Southern California.

The Produce Exchange of Los Angeles is the pivotal point around which a vast amount of the produce business swings. Week after week the exchange is widening its field of influence. The organization has grown remarkably since its reorganization last November. At that time there were twenty produce dealers connected with the institution, but during the past five months forty-one new members have been admitted.

Secretary Davies gives the following interesting statistics:

"The sales of eastern butter in Los Angeles now exceed in value $250,000 annually; and some of the wholesale produce and fruit firms of this city transact business with consumers in every State in the Union, as well as with customers in Mexico, British Columbia, Hawaii, Europe and trans-Pacific ports.

One Los Angeles firm handles over 1,250,000 pounds of butter annually, and also handles more bananas than any other firm in California. Last year's Orange County celery shipments netted the growers $300,000. The gross receipts for the present season are estimated at $600,000. The movement of hay in Southern California, the bulk of which is handled by Los Angeles firms, mounts up to more than 500,000 tons, and of this the city of Los Angeles alone consumes over 80,000 tons each season. One firm in this city handles 25,000 tons of hay per annum, valued at $300,000. The shipments of oranges and lemons to the East last season aggregated 30,000 carloads, and this will probably be excelled this season. These are but pointers to show to what an enormous extent the produce business of this section is expanding."

A glimpse into the handsome quarters of the local Produce Exchange at Central and Towne Avenues would certainly give all new ideas regarding local produce. A systematic acquirement of knowledge regarding the produce market is there carried on by Secretary Davies, who has a well-established reputation as an expert statistician and who has kept in close touch with our produce market for the past score of years. A daily call of the staple products of the market is made before the assemblage of representatives of all the principal wholesale houses, and there is buying and selling, and a daily settlement of prices on articles which fluctuate because of the incoming or outgoing of specially large shipments.

The Produce Markets

Los Angeles Markets.

Los Angeles, April 25, 1906.

Potatoes, beans and onions are commodities which show a marked increase since the San Francisco disaster and a rise may be expected on all staple products.

Butter.

The teats of some cows are very tender, and many cows kick because it hurts them to be milked, whereas their kicking is often interpreted as a sign of bad temper. It is a good plan to take the mildest view possible of a cow's kicking. It seldom pays to punish a cow, even for bad habits. Get her out of her bad habits through kind treatment.—Farmers' Friend.

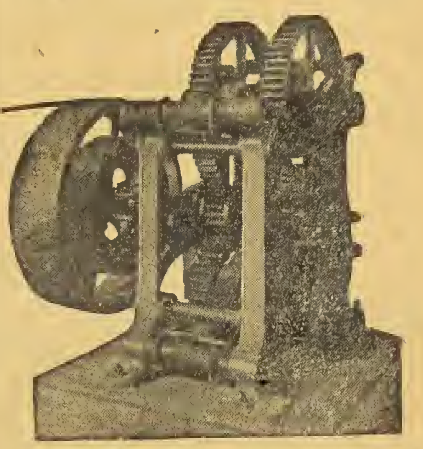
The excellent train service and equipment of the Salt Lake Route and great variety of routes offered affords opportunity for an enjoyable trip. Inquiries from prospective travelers will receive prompt attention from Agents or T. C. Peck, A. G. P. A., Los Angeles.

Well DRILLING & PROSPECTING MACHINES.

Fastest drillers known. Great money earners!

LOOMIS MACHINE CO., TIFFIN, OHIO.

The Pomona Pump



The New Pomona Pump is now being manufactured with machine cut gears and machine cut steel or bronze pinions. The pump fitted with this kind of gearing runs as smooth as a clock and there is absolutely no noise or vibration. The company have recently taken contracts for installing their largest sized pump with this class of gearing for the Artesian Belt Water Company of San Dimas, Western Water & Power Company of Glendora and other large irrigation companies. They are required to furnish these pumps with cylinders up to 12 inches in diameter and 72 stroke which has capacity of over 60 Miner's inches of water. The valves are made entirely of phosphor bronze with ground metal taper seats so there is very little obstructiin to the water in passing through them and it is impossible to clog them with sand. These, in connection with machine cut gears, in the pump head, make a strictly high grade pumping outfit and the best by a long ways of anything on the market today.

This head and valves are both protected by United States patent. Beware of infringing as both manfacturer and user are liable.

The company has recently installed one of their latest improved heads for the Santa Anita Land Company, a subdivision of the Baldwin Ranch. Below is what the owners have to say about it:

"The new 38 pump you installed for us on our tract on the E. J. (Lucky) Baldwin Ranch is giving us satisfaction in every way. We think we have the very best that money will buy. Both as regards to pump, material used and installation. We made an excellent change when we removed the pump we had been using and installed your make "

We have pleased these people and there is no reason why we cannot please you.

U. S. Carbolic Insecticide

Trade Mark **TREE WASH** Registered

To grow fruit profitably must become a study with the grower, and to raise it successfully he must be constantly watching and guarding against the pests that attack both fruit trees and vines.

This insecticide requires no heating or boiling of water, but is used simply by diluting with cold water, assimilating perfectly, requiring no agitation, forms no sediment, no clogging of nozzles, and will not injure the hands in the least, but will, like carbolic acid, heal and cure sores if on them. It is cheaper than any other preparation or method, considering the results obtained.

The best fertilizer to the trees. The one that leaves them clean and healthy. The one that brings results and pleases. The easiest prepared for spraying.

THE FARMER'S VEGETABLE GARDEN

The economic benefit of home-grown vegetables has been most clearly discerned during the last few years and the result is a gratifying increase of interest in farm gardening. More vegetables have been grown recently on California farms than ever before. The low market values of some of our most important special products have given an impetus to diversification of crops which a century of exhortation could not have compassed. California farmers have recognized as never before that sound farm policy generally requires the home production of most food supplies.

KATE'S SORE SHOULDER.

Kate was a faithful old horse, always ready to do her day's work on the farm; then, besides, if Aunt Molly wanted to go anywhere Kate was always harnessed up because she could be trusted. She kept fat until last spring. There was a lot of muddy weather in seeding time and Kate's shoulder got sore and she began running down fast.

Uncle Stephen was very busy and neglected the sore, mistaking Kate's willingness for a sign that the sore was not painful. One night he came to the kitchen door plainly worried and told Aunt Molly that he wanted some soap and water for Kate's sore shoulder. Aunt Molly was all sympathy, but she said: "Soap and water is the worst thing you can use. Haven't you got some Gall Cure? Father never would be without it."

But Uncle Stephen didn't like to be reminded about how Aunt Molly's father farmed and so he persisted in his soap and water.

Meanwhile Kate's sore shoulder was raw and the patient horse was getting distressed and poor.

Aunt Molly was a wise woman. She said no more about the Gall Cure, but that night she darned Uncle Stephen's stocking with a hard ridge on the heels. Next evening Uncle Stephen limped to the house nursing big water blisters on both heels.

"Try soap and water," suggested Aunt Molly. Uncle Stephen said nothing, but that very night he sent the hired man to town for a box of Security Gall Cure, and Kate's sore shoulder was well in a few days and she did her full share of work all the time.

IF A GIRL KISSED YOU.

Tom—"If a girl whom you liked, kissed you, would you kiss her back?"

Tim—"Of course."

Tom—"Well, I wouldn't; I should kiss her face."—Woman's Home Companion.

A nice uniform flock of hens roaming around the yards adds a great deal of pleasure to farm life, and will have a tendency to make everybody, young as well as old, on the farm more interested in the poultry business.

A Letter from J. M. Bull at King City, Cal.

J. M. BULL.

IS THERE ANYTHING IN POULTRY?

There are some that say: "There is nothing in poultry." Why, I knew a man, who two years ago was broke, and lost his home, but, today, he is one of the wealthiest men in King City. That is Nick Bray, with 900 of the prettiest Brown Leghorns in California. He ordered $74.00 worth of Coulson's Feeds from the carload I sold at King City.

$300.00 FOR FEED—$900.00 WORTH OF EGGS.

During the past year, (1905), Mr. J. Christensen, of San Luis Obispo, Cal., fed his flock of 300 laying hens on COULSON'S MASH EGG FOOD, every day, and the total cost of all feed used, during the year, was $300.00. He sold during the year $900.00 worth of eggs, making $600.00 profit.

5 WEEKS' OLD CHICKS—3½ CENTS EACH.

Mr. Christensen hatched out 312 chicks, and he fed them entirely on COULSON'S GROWING CHICK FOOD, dampened with a little milk.

He purchased 5 sacks of it, for which he paid $11.75. When the chicks were 5 weeks of age, he had 310 good, strong, healthy chicks, only two having died; and out of the 5 sacks of feed, he still had a bucketful left. So the cost of feeding them COULSON'S GROWING CHICK FOOD up to 5 weeks of age, was about 3½ cents per chick, and raised 310 out of 312.

WHY YOU SHOULD FEED COULSON'S FEED.

Eight pounds of COULSON'S MASH EGG FOOD makes a meal for a hundred hens, and it takes nearly twice that amount of inferior feed, such as bran, shorts, chop feed, etc., which do not contain nearly so much protein.

"Can feed 1500 hens—**'COULSON'S'**—FOR LESS MONEY than what it costs to feed only 1100 hens on the other feed."

For instance: Mrs. Marks, at Salinas, fed 1500 hens all last year on COULSON'S EGG FOOD and it did not cost her as much as it did to feed 1100 hens the year before on common feed. That was proof that **"COULSON'S"** goes the farthest; therefore, is the cheapest. She now buys COULSON'S MASH EGG FOOD in one-half ton lots, about every two weeks. She gets it at Mr. F. Blackie's store at Salinas.

The COULSON'S Feed is so much richer, and a more solid feed, so that the hens cannot eat nearly so much of it. All the poultrymen know this—those who have fed it. The hens NEED the rich feed and if they are fed COULSON'S, they do not eat so much of the other feeds, so that is the **SAVING.**

Then, if you get only two eggs extra a month, that would pay for COULSON'S FEED, and from the other cheaper feeds, you would not get enough eggs to pay for the feed. You know a cow gives more milk and richer, when fed on a good, mash feed; so does a hen make more eggs, when fed on the right kind of feed that **HELPS TO PRODUCE THE EGG.**

Some poultrymen are mixing cheap Blood Meal, that is half tanbark, to make Egg Food, which they can readily see if they will only LOOK at it. It costs 4 cents a month to feed a hen COULSON'S MASH EGG FOOD and it also costs 4 cents a month to feed the cheaper feeds, as you have to feed so much more of them.

Then, two eggs extra would pay for COULSON'S FEED, and many months afterwards, you will be realizing the advantage of feeding **COULSON'S** Feed, for you will be getting so many more eggs in the late Fall, when eggs are worth 50 cents a dozen.

OVER $100.00 IN 3 WEEKS FROM 350 HENS.

Last November, when I was at Hanford. I saw a good illustration: One poultryman with 300 hens did not feed any of Coulson's Feed—he was then getting only 4 eggs a day.

Mr. V. E. Hill, another poultryman, had 350 hens and feeds **COULSON'S** EVERY DAY, the year round, and at that time eggs were bringing 53 cents a dozen at Berkeley and San Francisco and Mr. Hill sold $117.30 worth of eggs in three weeks, and there are four and a half weeks to each month. So you can see that the man who feeds COULSON'S FEEDS, makes a whole lot more money during the year.

IT'S THE SUCCESSFUL POULTRYMEN WHO USE COULSON'S FEEDS.

Men like Mr. Freeman, with 5000 hens, and all of his brothers, making from $2000.00 to $5000.00 a year, are men of from fifteen to twenty years experience, and only buy goods from which they will get good results. They buy carloads of COULSON'S EGG FOOD.

Mr. De Rezendes, who feeds nearly four carloads a year of Coulson's Feeds, made enough money by it, to enable him to buy another large ranch of 300 acres, which he will also stock up with thousands of chickens and will feed them on Coulson's Feeds. He buys COULSON'S SPECIAL DRY CHICK FOOD by the wagon load, three tons at a time, and the EGG FOOD, 300 sacks at a time.

Also Mr. Gaston, with 3500 hens, has fed 3000 bags of COULSON'S Egg Food during the past three and a half years, and uses tons of COULSON'S SPECIAL DRY CHICK FOOD every Spring. See illustration. Their word is worth as much, or more than that of the many smaller men in the business.

OVER $1000.00 WORTH OF EGGS FROM 400 HENS.

Mr. Selecman, a farmer, who owns a large wheat ranch near Elmira, Cal. started to feed his hens COULSON'S EGG FOOD two years ago. According to a careful record kept during the year 1905, he sold $1146.15 worth of eggs from a flock of 400 hens; and after paying for all feed, including some $200.00 worth of COULSON'S EGG FOOD, he cleared a profit from these hens of nearly $700.00.

$4.00 A HEN.

Why, Henry Graff, who was elected president of the Pacific Coast Poultry Association, and who has 2000 fine White Leghorn hens, feeds COULSON'S MASH EGG FOOD every day, and the last year his hens laid nearly $8000.00 worth of eggs, or about $4.00 per hen.

The Coulson Co. has over 80 carload agencies in California, handling the feed in carload lots, and hundreds of stores handling the poultry foods in smaller quantities. This is proof that thousands of poultrymen are feeding Coulson's Feeds and you should be feeding them too.

INTELLIGENT MEN, that's the kind that feed their chickens COULSON'S FEED and make money.

Geo. W. Gaston's mammoth poultry farm eight miles from Petaluma, Cal. Here is the section of the country where the world's largest poultry farms are located. Here we see poultry farms that are a mile square and covered with poultry houses, occupied by thousands and thousands of chickens. The laying hens on the above place have been fed on COULSON'S MASH EGG FOOD once a day for THE PAST FOUR YEARS, and during this time, Mr. Gaston has purchased for these hens, more than **3000 bags** of Coulson's Egg Food; besides tons and tons of Coulson's Chick Food for the little chicks.

35c per hen PER YEAR is what it cost Mr. Gaston to feed them every day on Coulson's Mash Egg Food; $1.10 per hen including all grain, etc. Mr. Gaston is a practical and experienced poultryman, having raised poultry for the last twenty-five years. He is the owner of the above ranch, besides interest in other farms. The fact that Mr. Gaston uses Coulson's Mash Egg Food exclusively for his hens with such good results, speaks well for the merits of Coulson's Feed. Mr. Gaston is now raising 6000 little chicks on Coulson's Special Dry Chick Feed.

Good Roads in California--How Best Made

By the Editor

The good roads problem in California is much more easily solved than in most of the states of the Middle West. Our soil is largely composed of decomposed granite; it is easy to work at certain seasons of the year, and exceedingly difficult to handle at others. Until within the past few years we have depended for our thoroughfares upon the old state roads made by the early padres; we have, therefore, not given the attention we should to the character of our soils which enter into the manufacture of good roads.

Today the question which appeals to us is, how can we adapt our soil to our roads to best advantage at the least cost to us.

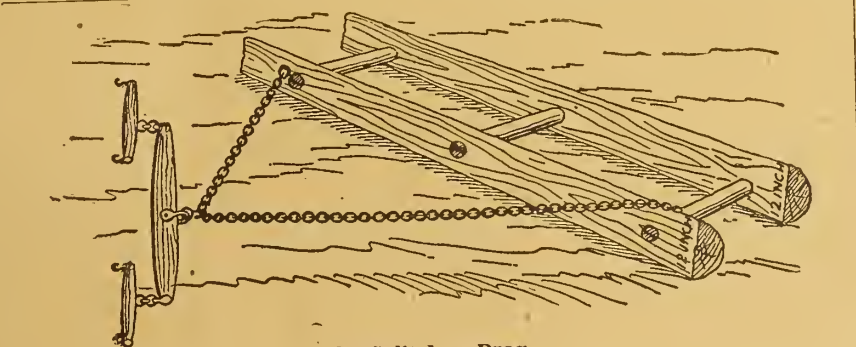
Experience has taught us that our roads cost more than our taxes and that more than one-third of the money we expend on our roads is simply thrown away. The roads are not made right to begin with, and they are not maintained after they are supposed to be completed. Road making is not a very difficult science; it requires study of the different soils to be used and how to use them, and it requires the application of common sense to the few known principles which form the basis of ordinary country road making. In general terms the principles we refer to may be applied as follows: (1) Economy; building at the least cost to the county or the district. (2) Completeness; building the road convex and leaving it smooth. (3) Capping the surface with dirt which forms the hardest, most resistant base on which to haul heavy loads without producing ruts or holes. (4) Yearly attention; going over the road once a month during the wet season to keep it in repair to withstand the strain upon it during the time no rain falls on it.

Heretofore, our Supervisors seemed to hold only one thought in mind; to do the work required for the present without regard to future results. This is false economy and a waste of the people's money. It has left us a system, or lack of system, of the worst kind; one which has given California the most abominable thoroughfares, as a general proposition, to be found north of Mason's and Dixon's line. But public sentiment is being awakened on this subject and the dawn of a better day is coming for our public roads in this State.

At a most interesting session of a Farmers' Institute held at Covina, recently, Mr. J. H. Reed, of Riverside, made the statement, in effect, that that city had expended $60,000 on its roads. That seems a large sum, but when you travel over the Riverside roads you readily see where the money has gone and you appreciate its value in price at which real estate is held on lands adjacent to these roads. Other communities are expending large sums on their highways and the interest is growing.

One of the first things to consider in road building is expense. Under the old way of making and repairing our roads we paid enormous sums and yet got very little; under the modern system we pay out little and get a great deal. That's the difference. In the cut which appears on this page this statement is verified. The split log drag is the modern farmer's road grader, road evener and road smoother, and the simplicity of the invention is what makes it so valuable. Now as to its simplicity. The cut when examined with a little care, will show how it is constructed. Generally it is constructed of a log, or telephone pole, 8 to 12 inches through, sawed in the middle, and from seven to ten feet in length, according to the strength of the team to be used in handling it. Bore three two-inch holes through each half in such a manner that the rear half, when set on edge, will stand 16 inches to the left of the front half, when set on edge as shown in the figure. Bore three two-inch holes in each slab, as shown in drawing; connect the slabs, facing the same direction, with three stakes or rounded 3x3's long enough to leave three feet space between the slabs after the connecting pieces have been driven into the holes and the edges wedged. Two or three planks can be nailed to these cross pieces, affording a place for the driver to stand, and, at the same time, strengthening the drag. Use a chain or strong rope for attachment to the doubletree. Supposing the drag to face west, and assuming that a chain is used, fasten one end of the chain to or around the left hand outside connecting brace, letting the chain pass over the top of the slab. If attached to the face of the slab near the left hand end, the chain would interfere with the movement of the dirt toward the end of the drag. The drag is run at an angle of about 45 degrees, so that dirt can be thrown toward one side. The other end of the chain must be fastened to the face of the front slab near where the righthand connecting piece comes through. The cut presented is an earlier type of the drag and does not show the logs arranged just in the exact position they should be. Still, that is not a very material point in the description. The drag does its work well. Shoe about three feet of the bottom edge (righthand side) of the front slab with a piece of iron or steel of the right length, about three inches wide and a half inch thick, with one edge sharp or beveled. Put it on securely, letting the sharp edge project about half an inch below the edge of the slab. This shoe will enable the drag better to shave the surface and cut down hard ridges which are usually met with on roads that have not been kept smooth.

The drag is now complete and does not have a nail or bolt in it except to hold the shoe on, and will cost from $3.50 to $5.00 and will last from five to seven years, depending on the frequency of use. A very satisfactory addition to the drag as described is made by taking a large iron ring made of 3-8 inch iron and have a blacksmith heat and draw one side of it into an extension which will fit over the links of the chain so as to hold position without slipping. The two halves of the log which make the drag should be thirty inches apart when the drag is complete, and if this looks too wide, it will be better to set it two inches wider. Many drags are rendered failures because the logs are set so close together that they do not clear themselves of mud.



The Split-Log Drag.

The split log drag possesses one important advantage. It kills the weeds on the side of the road. Used after rains—not when the roads are muddy—it will break down the weeds and so change the face of the road that it will not permit the seeds to germinate. This was the experience of the writer who used it in Iowa where the weeds were one of the most difficult propositions in road making and repairing the farmers had to overcome. The split log drag, if worked toward the center of the street will produce a convex surface and by using it once a month during both wet and dry seasons will give a smooth, hard surface, although not free from dust, of course—nothing will but oil, or the sprinkler, will abate the dust nuisance.

It should be remembered that the split log drag should be used after rains, when the ground is soft, but not sticky, for then it will add an additional layer of earth to the surface and at the same time fill any chuck holes which appear.

If it is desired to widen the road it is best to plow a very light furrow on the mark left by the righthand end of the drag as it has passed to and fro and then, with the drag spread the loose earth over the surface of the road so that the passing teams may pack it hard. This can be continued indefinitely until the road has reached the desired width.

Mr. King, the ardent advocate of the split log drag dissuades the use of the road grader preceding the drag, but this depends on conditions. If the roads are to be made up, after being allowed to go to pieces, a road grader is just the thing to do the preliminary work, for it leaves the dirt where the grader can catch it and renders valuable assistance in depositing it in the chuck holes—which the grader then makes smooth. But as a general proposition we believe that with the split log drag better work can be done on the dirt roads than is possible with a grader. The grader itself requires the strength of at least one team to pull it on good roads when it is running empty. The grader will deposit a large mass of soft earth in the middle of the road just where it is not wanted and just where it will collect a large amount of moisture with each succeeding rain. The purpose of the split log drag is to maintain the hardness of the surface under all conditions of weather.

There is no reason why our people should dally along with the abominable roads which are a continual menace to teams, harness and vehicles, let alone the good nature of the farmers. If the farmers' work is of such a nature that he can not drag his road on proper occasions, he can go into a pool with his neighbors and by chipping in a little money employ someone who will make it his business to drag the roads for a certain distance when the time is most opportune. Any sensible half-grown boy can operate the drag and do it as good as a man, when once he is shown how. Don't wait for any further urging; make a drag now. Get ready to use it at once and don't feel discouraged if it takes some little time to get a perfect road. Keep at it and our experience will be yours. You will get what you work for and be glad.

It is reported that the Supreme Court of California will establish its headquarters in Sacramento.

Deciduous Fruit Culture

BY J. W. MILLS, POMONA, CAL.

KEEPING APPLES

The Country Gentleman relates how to keep apples successfully over winter. It says that the storage room must be cold to prevent rot damp, to prevent wilting, and dark to prevent ripening. Cellars which have water on the floors from September to June are considered best for apples. In the fall the cellar windows should be left open on cool nights and not closed permanently till there is danger of freezing. A cellar temperature of about 30 degrees is advocated.

* * *

PRUNING PEACHES

The Massachusetts station made some experiments in pruning peach trees, leaving one row for nine years without pruning. The effect was as might have been expected, leaving the lower part of the main branches bare with the fruit wood weak and high up in the trees. The trees were less vigorous and thrifty than pruned trees of the same varieties. A row of trees next to them was pruned in the usual way which made them healthier and more vigorous trees and they withstood the cold winter much better. The most interesting feature of the experiment was that late spring prunings gave better results. This is what we have advocated for California where possible.

* * *

BUD VARIATION

The Country Gentleman cites examples of bud variation in Winesap apples and some other fruits including the strawberry and emphasizes the advisability of using buds from only tried specimens of plant for propagation. This caution cannot be too frequently published and the Cultivator has never lost an opportunity to do it. Still perhaps 99 per cent of the persons who purchase fruit trees take anything as long as the variety is guaranteed.

I wonder what the proportionate increase in the valuation of the orchards of this country would be if it were taught in the public schools that this is one of the vital principles in horticulture and agriculture?

Suppose that Tom learned at school that part of the 100 Seller's Cling peach trees that his father bought might have been propagated from a tree that was known to be a shy bearer or the parent tree might have been one of those trees that seem to be a "little off," for it was known that the nurseryman who propagated the trees which Tom's father bought got his bud from Mr. Brown's orchard in which were several of those kind of trees, but the nurseryman did not know about it. What would Tom's father think about the possibility of having to care for some trees for a long term of years, some of which might not give him near as much in return as some other in his orchard, when with a little forethought he might have had them all alike and good? On the other hand, the teacher had mentioned that in getting his facts together he had learned that Willie Smith's father had bought some trees which were propagated from a tree in Mr. Work's orchard which was noted for its abundance of fine fruit. Tom had told his father about this and got his father so much interested in the case that he set out to find out what he could about it. Is there any doubt but what an intelligent man would do this? Would not Tom and the other boys remember the lesson when they grew up and were planning to grow some fruit of their own?

Some sort of an agricultural or horticultural society would be of immense value in disseminating this kind of knowledge, but the school would get at the foundation of the population and would give the facts to the largest possible number. The work need not take more than parts of a few days in a month and would constitute one of the most fascinating branches of nature study. It would be practical to the highest degree as it would be directly in the line of refining the chief industry of the whole human race.

ORCHARD FERTILIZING

"By practical experience I will say that after five years of test I found the use of commercial fertilizers to pay. No one in this age can expect soil to stand the strain that our high cultivation draws from it.

"Take, for example, our prune orchard, by use of fertilizers, bearing in 1902 thirteen tons of green prunes per acre; peaches the same. Many will ask what size was obtianed. They were larger than those in orchards bearing three tons to the acre, and many of the three-ton not being packed at all.

"Take the average orchards bearing five-ton green prunes per acre, and use fertilizers. If you only increase the size say 50 to 60, or $10 per ton dried, allowing two to one in drying, we have $25 for increase per acre Cost of fertilizer and applying on orchard, $6 per acre, leaving a profit of $19 per acre.

"This is not allowing anything for increase of tonnage per acre, which I think can be safely put at one-third, or in round numbers, say the orchard that produced five tons without fertilizers will produce seven tons with fertilizers, making an increase in size of fruit and increase in tonnage $35 per acre, or a net profit of $29 per acre.

"Then, again, we must not lose sight of the fact that we are keeping our trees in a sound, healthy condition, thus making them less liable to be attacked by insects and fungus growths.

"In closing, I would say that experience has taught that no man can afford to drain the soil and not return some of the profits taken from it; that commercial fertilizer is the cheapest and best, for you only pay for that part your trees and fruit are in need of."—B. F. Knapp at Mountain View Institute.

RESISTANT VINEYARD

The grape growers of Santa Clara Valley have been for some years experimenting with various kinds of vines, striving to find out what variety is best suited to the different parts of the valley, and to discover some kinds that will resist the phylloxera. They have had but indifferent success. One of the enthusiastic growers has recently taken a trip to Martinez for the sole and express purpose of studying the methods of the growers in that part of the State, who have had remarkable success. This man, George A. Muirson, a grape grower, was interviewed on the results of his visit, and gave his observations freely, believing, as he did, that a great many vneyardists and fruit growers would be interested and profited thereby. John Swett, whom he called upon, is president of the Viticultural Society of California.

"Having a desire to see a resistant vineyard of some magnitude where the grapes were almost ready for market," said Mr. Muirson, "I visited Hill Girc Vineyard, near Martinez, California, the property of John Swett & Son. It is beautifully located in the Alhambra Valley and adjoining foothills, and consists of upwards of one hundred acres, about eighty of which are planted in vines, all of which are on resistant roots.

"The Rupestris St. George stock is mainly used and gives the best satisfaction in general . For ground that is in any way obstinate, other stocks, such as the Riparia, Rupestris Martin and Solonis, etc., are used. Where black oak has grown the ground proves very refractory and Riparia Rupestris 3306 is found to succeed where the other stocks fail.

"This vineyard was reconstructed on the same ground which, until eight years ago, had borne the vinifera until the phylloxera had compeltely destroyed it, and in this particular it was gratifying to behold the effects of the beautiful vineyard, re-established on resistant roots. From one end of the vineyard to the other the vines were, with rarely an exception, perfect in vigor, leaf and fruitage. Some bearing at one, two. three and four years of age; and. as I was informed, larger crops than the same varieties bore on their own original roots. It was indeed tempting to see and taste the luscious muscats, sultanas, cornichons, tokays, etc.

A telephone connecting most of the farmers of any locality is a benefit to certain business men in the town where "central" is located, but to others it is not. There is a good deal of selling and buying done over a telephone line, and dealers in town do not get a hand in. This is especially true of grain and seeds.

Tree Protectors

75c per 100. $5 per 1000.

As valuable in summer against sun-scald, hot winds, etc., as they are in winter against cold and rabbits. Recommended by all leading orchardists and horticultural societies.

Send for samples and testimonials. Do not wait till rabbits and mice ruin your trees. Write us today. Wholesale Nursery Catalogue now ready Write for copy. Agents wanted everywhere.

Practical Farm Science

OUR FARM BIRDS

Any bird that eats the codlin moth must, of course, be regarded as an ally, and this useful work is done by the Black-Headed Grossbeak and the Bullock Oriole.

Hardly less valuable is the quail, whose favorite diet is the potato bug, the cotton boll weevil and various noxious worms.

The linnet is not wholly blameless. He certainly eats a good deal of fruit, but he substantially varies his diet with large numbers of seeds of noxious plants and weeds and, on the whole, he does more good than harm.

The same may be said of the blackbird, who has a decided taste in fruit, but who prefers worms and insects. This is shown by the assiduity with which he follows the plowman. It may therefore be said that he gives good value for what he takes in the way of fruit.

The bushtits, the kinglets and the Audubon warblers feed almost entirely on insects that are prejudicial to fruit. They must therefore be considered as friends.

The California jay is a criminal with a bad record, and the Washington authorities believe that in some places they are too numerous.

From this valuable report it is evident that bird life in California has been treated with some injustice. Evil is usually more conspicuous than good, and while the farmer is painfully conscious of injury to his fruit it is not so easy to recognize the unobtrusive work that is done in devouring insects and seeds that would otherwise prove to be far more serious enemies.

The report concludes with the admirable opinion that the birds of California are too precious to destroy without great cause, and that under no circumstances ought this to be done without a thorough knowledge of their habits. Even where they are obviously mischevious it may be due to some special and temporary cause, such as a shortage of their own particular food.

CALIFORNIA A GREAT STATE.

The following is an extract from an address delivered in Italy by Signor des Planches, Italian Ambassador to the United States, after his visit to California:

"From whatever point of view one looks upon California, first famous as a land of gold, and afterwards a great center of agriculture, it is at this time a country whose prosperity far exceeds anything that could have been expected when people were unacquainted with its resources. It is today a land whose prospects are still far more encouraging than at any time in its history.

"With a rich and fertile soil, its mild climate, and room enough for many times its present population to live in comfort , it is certain that California will in time develop into a splendid social, agricultural and commercial world center. Although this great State has already achieved a great industrial importance, when one considers the wealth of motive power that will be soon developed by harnessing all her hydraulic resources, the industrial future of California is great indeed, and I may say also that she will become a social, civil, artistic and literary world center. Already California has two great universities that are without a peer—Berkeley and Stanford—from whence have come some of the best writers in the United States, and of whom the entire United States is proud indeed. California boasts of better school facilities in proportion to her population than any state in America.

"Considering all these things, what has already been accomplished and the still greater future progress that awaits this land of inevitable resources, there is no doubt that those who go there in time and find their way to enjoyable conditions will naturally progress apace with the gradual development of the country. This is the natural outcome of the course of events, particularly where there is intelligence coupled with indomitable energy and push. The long distances which people formerly went to come to California have exercised a selective influence and brought only the best people to the Golden State, while methods of rapid transportation have shortened her distance from every part of the world.

"California is no longer what it was fifty years ago—an isolated commonwealth, further removed from the world's centers than is South Africa today. A magic change was wrought in the history of the Golden State when the first transcontinental roads were open to traffic. It can be said, furthermore, that California can now be reached in ten days from Europe and about eighteen days from Asia."

IRRIGATION IN THE WEST

We are not accustomed to think of the United States as an arid country, and it is hard to realize that one-third of our area has insufficient rainfall for the proper culture of crops. Nearly one hundred million dollars have been spent in an effort to remedy this deficiency of nature; and if the length of all the irrigation canals and ditches in the United States were taken together, the mileage would encircle the earth more than twice. Some ten million acres of land were under irrigation when the Census Bureau made its report in 1902, and since that time at least half a million more acres have been added. Over one hundred and thirty thousand farms have been benefited in this way, and the total outlay has averaged $10 per acre. The irrigated area is increasing steadily; during the three years previous to the Census statement, it was extended 30 per cent. It is becoming every year more costly to obtain water, because in most of the States the easily accessible supplies have already been utilized; and it now requires more labor, and consequently more expense to reach it.

The Western States, of course, have received the greatest advantage from this work, Colorado and California each having about one and three-quarter million acres of land artificially supplied with water, but many States in the East and South have applied the system for the growing of vegetables, oranges, tobacco, hay, etc.

ORANGE-GROWERS have discovered by actual tests that a fertilizer containing not less than 12 per cent. of POTASH (in the form of sulphate) insures the most abundant yield of finest fruit.

Our books on successful fertilizing are free to you, without cost or obligation, if you will write for them.

California Horticulturally

BY JOHN ISAAC, SACRAMENTO, CAL.

FRUIT CONDITIONS FAVORABLE.

As we have stated before, there is always a tendency in the early fruit season to indulge in doleful forebodings. In all our California experience, there has been hardly a season in which early climatic conditions—rains, winds or frost—have not done some damage, and which have not given rise to assertions that the entire fruit crop was destroyed, yet there has never been a season when the results have borne out the prediction. This season has been no exception, yet as the season advances, and we are able to get the facts, we find that there will in all probability be a good fruit season after all. Cherries, as a rule, are yielding very heavily and small shipments have already commenced to arrive from the Vacaville district. Apricots, there is no hope for; they are a failure. Peaches will give a fair crop in the State. Some of the earlier blooming varieties, as the Phillips Cling, will be very light, but on the whole the crop will at least equal that of last season. The blight which has appeared for the first time this season, or at least has become conspicuous, is doing much damage to the new growth of peaches. Prunes so far promise well. Pears are setting well, and will be a good crop except as the blight has affected them. Almonds are somewhat spotted, but will be a light crop on the whole.

* * *

PEACH BLIGHT SPREADING.

Reports come in from all sections to the effect that the peach trees are blighting badly ,and as a rule the disease is a new one to most people, having been unnoticed heretofore. Orchards all over the State are suffering from its attack, and it has broken out in a more virulent form this season than ever before known. As the disease is a fungoid, either the shot-hole fungus, or closely allied thereto, it is probable that weather conditions have much to do with its rapid and extensive spread this season. As before recommended in these columns, orchardists whose trees are attacked by this disease should spray with the Bordeaux mixture as soon as possible after the trees become dormant in the fall. The object being to destroy the germs of the new fungus crop before they have had an opportunity to get a foothold.

* * *

HORTICULTURAL INSECTARY DAMAGED.

The effect of the late terrible catastrophe in San Francisco will be more far reaching than it is possible to realize. Even the orchardists of the State will feel the effect of it in loss suffered by the Horticultural Commission. The insectary, at which all beneficial insects have been bred from which they have been distributed to all parts of the State, was situated in the Ferry Building and while this structure has been spared from fire, it was so badly shaken by the earthquake that not an office escaped. The walls of the insectary were shaken down, the cases in which the beneficial insects are bred were crushed into kindling wood, and the whole buried beneath a heap of rubbish. Efforts were at once made to rescue all the stock possible from the ruins, but the losses have still been great and it will take some time to repair them and get the office in working order again. In the meantime there will be much delay in getting beneficial insects for distribution.

* * *

REMOVING LARGE TREES.

In making the alterations to the Capitol building it became necessary to remove a number of large trees and bushes which were in the way. The matter of handling these so that they should not suffer from the operation was a difficult one, especially as they were making their first spring growth at the time and were in their most tender condition. The work devolved upon State Gardener John Reeves, and his success in the matter entitles him to commendation for his skill and care. Very many of these trees were valuable, and some of them rare, yet all have been moved to new stations and although the operation took place several weeks ago they are still growing and have not lost a leaf, in fact they do not realize that they have been moved. In their removal a large trench was dug around them far enough removed from the roots to insure that they should not be interfered with. A heavy box was then built around then and the bottom worked under each tree, so that the entire root system of the tree remained undisturbed in the original soil. They were then removed with a block and tackle and as carefully established in their new locations. It required a great deal of skill and labor, but the trees were worth it all.

* * *

DANGER FROM IMPORTED PEACH STOCK.

There has been so great a demand for peach stock for planting in this State for several years past that our nurserymen are starting a large quantity of this stock in order to supply the increasing demand for it. There have been very large shipments of this stock from Eastern nurseries, which is to be regretted for two reasons; first, there are many peach diseases in parts of the East which have never yet appeared in California, and while every effort has been made to prevent the entry of any of these, there is still a possibility in spite of the greatest care, of introducing some undesirable disease when such large quantities of stock are imported. Every effort has been made to ascertain from what section such stock is imported, and if within an affected area, it has been stopped, so that the danger of importing disease or pests has been brought to the lowest point. Secondly, of course it is better to produce our own stock than to import it. This, however, is a small consideration as compared with the danger of importing new pests and diseases, which may play havoc with one of our greatest fruit industries. The dangers principally to be feared in peaches are Yellows, Rosette, Littles, and the Eastern Peach Root Borer. We have none of these pests in our State at the present time, and they are certainly very serious in the sections of the East where they are established, rendering peach growing in some places impracticable and unprofitable.

With the Citrus Growers

BY J. W. MILLS

POSSIBLE COMPETITION.

There is a always a consciousness with a large part of our citrus fruit growers that the tropical fruit-growing sections within shipping distance of the Atlantic seaboard will cut into the orange market of California and Florida. This is but natural, and is sure to follow in some form or other. It may perhaps be oranges that will come in, and there are sure to be different varieties of fruit that will have a certain influence on the orange market. The apple crop of the East acts as a sort of barometer, barring other conditions, in indicating the possible demand for our oranges. When there is a large crop of apples in the Eastern States and that fruit is cheap, people will use apples instead, partly because they are cheaper than oranges and partly from choice. When oranges have been used freely for awhile, apples are a pleasant change, and when apples are available at reasonable prices they are in greater demand than oranges. The same may be said of various other deciduous fruits, but with the exception of pears, such fruits have not been available, but now comes some South American statistics that show an awakening in fruit culture that few of us are aware of.

The Argentine Republic now has 200,000 acres planted to fruit trees and 120,000 acres in grape vines, 320,000 acres in all. The industry has reached a point where export trade is being worked up. They harvest their fruits during our winter season, and should they run their peaches, plums and grapes into our orange markets in competition, there would certainly be some influence exerted that would affect our prices. This may not happen for some time, but it is one of the possibilities. Water transportation is cheap, and science has come to the aid of the shipper till now it is possible to ship perishable fruit half way around the world and land it in good condition. Argentine is only a small fraction of South America that is adapted to deciduous fruit culture.

Of the different fruits grown in the country referred to, not counting grapes, 40 per cent are peaches, 20 per cent citrus fruits, apples and figs 10 per cent each, pears, plums and quinces 5 per cent each, nuts, cherries and all other fruits, 5 per cent. Peaches and plums do particularly well, especially plums. Apples and pears have not assumed an important place. Bartlett pears, in addition to our Eastern apples, put on the market in February and March, would no doubt have a depressing effect on our orange trade.

Quite recently a European horticulturist made a tour of the United States for the purpose of investigating American methods of horticulture, and paid particular attention to California methods, especially irrigation. He was on his way to Uruguay to take charge of a large body of land for a French company which was preparing to engage in fruit culture. We were told that this land and the climate that went with it had been proven a desirable fruit growing section.

We need usually have no fear of large fruit growing corporations revolutionizing the fruit growing industry, but they usually work out some important problems directly or indirectly. They prove that something is doing in their line; or else they would not be attracted. At any rate they are straws which show us the way the wind blows.

BARNYARD MANURE AGAIN.

One of the features of the knowledge of use of fertilizers that has puzzled many an amateur orange grower, came to our notice some time ago when a prominent Riverside grower related his experience in the search for fertilizer knowledge. He said there was but one thing that all Riverside growers whom he consulted agreed upon, and that was that barnyard manure was not good to use on orange trees; it made the fruit coarse. Now, this man has found that he cannot make his fruit coarse on his soil after applying ten cubic feet to the tree for several years, but has succeeded in materially increasing the yield. He is not alone in his views now, however, as growers are all flocking back to stable manure.

Now comes the report that one of the English stations has come to the conclusion that barnyard manure is more valuable than commercial fertilizers, but both were good. When potash was left out of the commercial, the effect of the commercial fertilizer was obliterated in most soils. Ten tons per acre of barnyard manure supplied sufficient potash to make up the deficiency.

CLOSE VS. WIDE SETTING OF ORANGES.

Many have expressed the belief that our orange groves are set too close, and while no harm comes from this source while the trees are small the time will soon come when some change must be resorted to in order to give the trees more room. For an orange tree if properly cared for and given plenty of room is of great longevity.

The belief that our groves are too closely set goes along with the idea that an orange tree should not be pruned; and in case they are not pruned they should surely be given more room in which to grow· for if allowed to they will grow to a large size, some of them attaining the width of 40 feet and retaining all their luster and glossy foliage and bear their annual crops as in their early vigor. Indeed youth appears never to end with an orange tree if properly treated. It logically follows that there are two methods, one of wide setting with little or no pruning, except removing dead limbs. The other of close setting, say 22 to 24 feet each way, to be followed with a liberal annual pruning, say after the grove reaches an average bearing capacity of about six boxes to the tree, as before this stage the orange tree needs to be pruned very sparingly with only a shaping of the tree, owing to the fact that they are the nearest self-regulating in the matter of setting their fruit crops of any fruit-bearing tree that I know of. But there is a limit to the size of their top if their space is limited, and if closely set they must be closely pruned, and if neglected too long it takes them longer to recuperate.

I prefer the close setting method, for there is no reason why a larger yield of fruit can not be had from a greater number of trees well cared for and an annual supply of fresh fruit bearing growth, produced by a careful and judicious system of pruning to be continued during the life of the tree; which the present proprietor need have no fear of ever living to see the end of, providing that conditions are normal.

In further support of my idea a large part of the value of an orange grove is its beauty, and a grove of trees of moderate size are far more beautiful than a grove of over-grown trees, which one can neither see over nor between, besides the picking and pruning of a small tree is a thing of pleasure while on the large tree it is extremely dangerous, and why is not twelve boxes of oranges from two small trees as good as twelve boxes from one large tree?—J. W. H., Rialto.

The Ornamental Garden

BY ERNEST BRAUNTON, LOS ANGELES, CAL.

FIESTA FLOWER FESTIVAL

The most attractive feature of Fiesta week will be the Flower Show held by the Southern California Horticultural Society, in Blanchard and Symphony Halls, Los Angeles, May 9th to 12th. This Society last November held the most successful flower show ever inaugurated on the Pacific Coast and the only one in the State that ever proved a financial success. In the forthcoming one Symphony Hall will be devoted entirely to sweet peas and the exhibition throughout will be one of cut flowers. The plant exhibition will be held in November.

No visitor or resident should miss this show for it will be the first chance in many years to see assembled all the floral glories of Southern California under one roof. Over $600.00 in cash prizes will be awarded in addition to a number of valuable cups. Don't forget the time and place.

SEED FOR LAWNS

In procuring seed for establishing a lawn, too great care can not be exercised. Pure seed, of high germination, is of great importance in securing a good stand of grass. Pure seed is the keynote to a clean lawn, provided the work of preparing the land has been efficiently done. Thorough preparation involves not merely the mechanical treatment of the soil to reduce it to a proper seed bed, but the use of weed-free manure and the adoption of a course of treatment previous to preparing for the lawn which shall serve to eradicate weeds. Such preparation, coupled with pure seed, should give a satisfactory stand of grass which shall need only the usual care necessary to maintain a lawn after it is once established. Too much can not be said in favor of securing pure seed, and, if possible, specially selected seed. This is of considerable importance with light seeds like bluegrass, redtop, and seeds of the bent-grasses. In the case of bluegrass, select seed weighs about 22 pounds to the bushel, while the ordinary grade of bluegrass, although it may be called pure, averages about 12 pounds to the bushel. Select or recleaned bluegrass is, therefore, the most economical to buy, although the original cost is considerably more than that of the common commercial article.

The stand of grass resulting from the use of recleaned, selected seed is much more uniform than when seed containing a great number of hulls and light seeds is employed. The same remarks hold with the bent-grasses, and even with white clover, although the market at the present time does not offer as much opportunity for selection with this last-named seed as with the bluegrass.

The quantity of seed to be used upon a lawn is of decided importance. It is better to use an excessive amount of seed and allow natural selection to eliminate the weak specimens rather than to seed sparsely with the hope that the natural habits of the plants will be sufficient to enable them to take possession of the entire area. A thick stand of plants of the desired species gives little opportunity for the development of weeds, while a thin stand of the same species offers a place for the growth of weeds, which may become determined competitors for the possession of the ground, thus subjecting the gardener to the necessity of eliminating the weeds or of re-establishing the lawn. Heavy seeding of grass is, therefore, a very important matter in the establishment of lawns.

PLANTING ON LAWNS

Trees and shrubs upon small places should occupy subordinate positions. They should not be scattered promiscuously over the surface of the lawn, but should be used in groups about the border of the grounds, in the bays of walks and drives, and about the foundation of the architectural features of the place. Street trees of necessity must be planted in rows, but all other adornments in the form of trees and shrubs should be used in a free rather than in a formal fashion. Sheared hedges of box or privet along the front of a place or upon the borders of the walks and drives are seldom or never desirable features, unless the whole treatment of the place is extremely formal. A specimen tree or shrub if properly located upon the lawn so as to break up the barrenness of a corner or to limit the vision in any direction is an appropriate object. Oftentimes trees and shrubs can be used to good effect in the immediate vicinity of buildings for softening or relieving staring architectural lines. Of late many plans for the decoration of gardens and grounds have suggested the use of trees and shrubs more in the manner of paling fences and statuary than as living objects carrying individuality. The aim should be to preserve the natural lines and characteristics peculiar to each species of plant used in any decorative scheme rather than to shape the plants into artificial forms. It is the height of folly to prune evergreens in the form of Chinese vases, animals, and articles of furniture. This type of distortion is becoming altogether too prevalent in the mad rush toward the supposed return to nature. Let us not forget in the treatment of our places that nature unadorned is adorned most, and that the normal, naturally pruned tree or shrub is much more beautiful than the one which has been trimmed into mimicry of some artificial object.

Trees and shrubs should be used to conceal unsightly objects in the foreground or in the background, to give the idea of surprise or discovery in passing from one portion of a large estate to another, and for the purpose of increasing the apparent length in drives which double back upon themselves in parks and pleasure grounds. Evergreens which are used upon the lawn should have the lower branches preserved so as to produce the effect of arising from the ground not merely by a stem but as a mass. Shrubbery groups should also be chosen so as to carry the foliage of the group to the greensward rather than to present a considerable extent of bare stalk between the foliage of the shrub and lawn.

As was stated at the outset, the lawn is the canvas upon which the architectural and landscape effects are to be produced, and all artificial structures, as well as plantations, should be made to harmonize with the contour of the ground and with the general scheme of the place, so as to produce a harmonious and pleasing picture.

"POOR MAN'S ORCHID"

Many Eastern bulb dealers advertise the iris family as "the poor man's orchid,' claiming that for cost and care, compared with results, iris will give you better satisfaction than any other plant. We beg to disagree. Iris have many fine colors and forms but in no wise compare with the gladioli in resembling the great family of orchids, either in form or color. Their cost is within reach of all and in California they should be found in every garden. Wonderful improvements are being made each year and naturally the gladioli is very variable, but unfortunately we generally see but one or two types.

WALKS AND DRIVES

While walks and drives should always be direct, they should be made to conform to the contour of the surface. In large areas and where the surface is undulating they should follow the contour of the land instead of being made straight. On small areas, however, there is no advantage in curved walks.

Pasadena boasts of her four or five miles of fine streets and beautiful shade trees, but what is that compared with the twenty or thirty or forty miles of handsome tree-shaded drives we can boast for Riverside?—Press.

We sell country lands. CHATFIELD & VINZENT, 228 Montgomery St., San Francisco, Cal.

In the Vegetable Garden

BY ERNEST BRAUNTON

VEGETABLE GARDENING.

It is comparatively an easy matter to grow a good garden if the owner takes the trouble to post himself and gives the necessary attention at the proper time. The best soil for vegetables is a deep, light, thoroughly drained sandy loam, well filled with vegetable matter. Deep and light soils abound throughout three-fourths of the state. If drainage and humus are wanting they must be supplied. Few soils can be made to give the best results as vegetable soils until they have been properly cultivated and manured for vegetables for several years, no matter how rich they may be considered by their owner, or how well they produce other crops.

The success of all subsequent operations in gardening depend upon the preparation of the soil. Unless stiff, tenacious clay is near the surface, plowing cannot be too deep in soil of even moderate fertility. If a soil is originally but 5 inches deep, and by plowing and incorporating manure it is made 10 inches, its quantity is doubled and its producing capacity doubled or more than doubled. Soil for vegetables should be at least 10 inches deep and pulverized throughout. A soil in a poor physical condition may contain fertilizing materials in quantities sufficient for the production of good crops, but not in an available form, and useless for plant growth until the soil becomes friable and aerated. A soil that is the most friable and mellow and possesses the greatest porosity has the greatest capacity for fertilizing materials and resists leaching and drouth. Thorough and deep pulverization not only renders available the inert plant food contained in the soil, but enables the roots to ramify through greater area and distance in their search for food. Plowing and harrowing should be continued until there is no doubt but that the soil is in the proper condition, even should it be necessary to repeat both plowing and harrowing several times. The failure of many crops is due to inadequate preparation of the soil, and that alone. It is too often the case that preparation of the soil is delayed until the time for planting, when the haste to get the seed in is greater than the care of preparation.

SOIL FOR VEGETABLES

Sandy soil and sandy loam give up water readily, so in many localities we have thirsty land; again under other conditions the land becomes "water sobbed." Soil that is too dry or too wet is not fit for vegetable growing. Careful mechanical analysis shows that there need not be any difference in structure between thirsty land, "water sobbed" and good vegetable land. The difference may be one of water supply. It should not be understood that if all thirsty land were irrigated it would make good vegetable land, nor that all "water sobbed" land if properly drained would make good vegetable land.

TURKESTAN WINTER MUSKMELONS

The production of winter muskmelons is largely increasing in California, as the local climate is splendidly suited to these late-ripening and long-keeping sorts. A number of varieties secured in Russian Turkestan by an agent of the Department of Agriculture were grown at the substation near Pomona. Planted late in May they made their growth in a very dry year without irrigation and all the varieties proved four times as prolific as the common garden varieties of muskmelon planted under similar conditions. All are melons from the native home of the finest known varieties, in the famous oases along the historic Oxus, the ancient Chorasmia and Sogdiana.

POTATO SCAB

Try soaking your seed potatoes in corrosive sublimate mixture and thereby lessen your scabby potatoes. Try some soaked and some unsoaked; it will convince you. From a single experiment carried on during the past year, the results showed that where barn-yard manure was used alone the potatoes were five times as scabby as they were where nothing was used. Where lime was used alone, they were four times as bad. Where both manure and lime were used together the scab was three times as bad.

KANSAS STANDARD TOMATO

This variety, received from Lawrence, Kansas, has demonstrated its value in this State. It made a strong, healthy growth in the experiment station garden at Berkeley; and its adaptability to the Bay region climate seems to be demonstrated by the fact that it was the first variety to ripen seed with us for some years. It is somewhat dwarf in habit and is perhaps slightly deficient in flavor, but it is a remarkably prolific fruit-producer.

TOMATO NOTES

The influence of heavy manuring upon tomatoes has engaged attention for a number of years. It is a common belief that the tomato, unlike most plants, is not benefited by rich soil or heavy fertilizing. "The plants run to vine" the gardeners say. There must be some truth in this belief, else it could not have become so widespread and be held so tenaciously. Productiveness in the tomato in the northern states is largely, if not chiefly, a question of early bearing; the plant will outlive any northern season, and its life in the East is therefore determined by contingencies of frost rather than by any inherent limit of duration. The plant matures here and continues to bear for many months, if not destroyed. Some have carried plants in bearing condition through two or more years. It is apparent, therefore, that any fertilizer which is not at once available to the plant but which gives up its materials comparatively late in the season, will maintain a vigorous growth and probably eventually bring the highest fruitfulness. Coarse stable manures belong to this class. It is some time before they become thoroughly decomposed and incorporated with the soil, and if applied heavily it is probable that they will delay the crop. Our seasons are long enough to allow the plant to live out its natural lifetime, the materials will be gradually used and the total productiveness of the plant be as great, if, in fact, not greater, than it would have been under a treatment which caused it to bear heavily at an earlier period. Thoroughly decomposed manures ought to give quicker and more satisfactory results than coarse ones, and proper concentrated fertilizers might give better results than either.

THE LENTIL

The lentil is a small branching plant with delicate pea-like leaves. The small white flowers growing in pairs are followed by flat pods, each containing two very flat round seeds, convex on both sides. Unlike the pea and bean, the lentil is eaten only when fully ripe. The brown or reddish lentil is smaller than the yellow, but of more delicate flavor.

The lentil is one of the most ancient of food plants, probably one of the first to be brought under cultivation by man. It has been brought from Holland and was accounted "fit dainties for ladies, they come so far and cost so dear." From the market gardener's point of view, the pea is the most important of the legumes. In this country and in Europe great quantities are consumed in the green or unripe state, and in Europe the dried or "split" pea is as largely used as the dry bean; with us it is less popular.

THE "SWEET-AS-HONEY"
WATERMELON
IS LIKE A VISIT TO OLD DIXIE

Lilly's "Sweet-as-Honey" Watermelon is just the melon for your own home garden. This melon ripens clear to the rind, and the flesh is a bright crimson, crisp and crackly.

A bite of the "Sweet-as-Honey" melon suggests Ambrosia, the food of the Gods. It is good to the last bite.

Too tender for shipping. A treat for a hot summer day, eaten at home. It will ripen in those sections of the Pacific Coast where it is popularly supposed melons will not grow.

"Sweet-as-Honey" melon seeds sold only in sealed packets. Price: **Pckt. 10c. Oz. 25c. ¼-lb. 75c. Lb. $2.00 Postpaid.**

Complaints About Packers—There is bitter criticism of the method adopted by growers and packers who cap their berry boxes with fine samples and fill the under layers with indifferent fruit. This year the complaint on strawberries is more general than for some time. Shippers who thus undertake to deal dishonestly with the public deserve to suffer. They are not wholly to blame for the grower comes in for considerable blame, but they should see to it that rubbish and half-rotten fruit is not allowed to be packed in boxes under any circumstances. It is not alone incumbent on the grower that he refrain from dishonest practices in putting up his pack of fruit, but it is his moral obligation and he should see to that each and every item he sends out is fixed up in the best possible manner. Leaving out of consideration, however, the moral side of the question, it will pay him.

The grower who packs his berries with perfect samples throughout will soon obtain an advertisement which will enable him to sell his produce to advantage, while the dishonest grower will lose both in price and in reputation and finally be driven from the market.

Honestly packed berries, as well as fruit of all kinds, invariably bring good prices, even when the markets are glutted. There is always a good demand for good stuff and a reputation for honest packing is a jewel worth a big price to any grower or association.

The Chicago Packer recently called attention to another fraud which shippers report has caused bitter complaint. It appears that cars of fruit and vegetables are so loaded that all the good stuff will be found near the car doors upon opening them with almost worthless goods in the ends. Such shippers evidently think that they will do business only once with receivers to whom they are undoubtedly right, but it might be added that for the most part, such crookedness is detected too early and it does not work to the profit of the shipper even in the first instance.

We are always impressed with the name of a fruit grower on a fruit package. It gives responsibility to the brand and buyers take it as a favorable indication of the growers' honesty and reliability when he is willing to put his name or label on all fruit he sends out. There are some growers in California whose berries command a fourth more in the market because their name and brand stands for honesty, and perfection in their fruits. This is worth a great deal to these growers as such a reputation is a guarantee of the best prices no matter how glutted may be the market.

As a business matter, it doesn't pay to be dishonest in packing. Grade carefully and pack honestly, these are the two elements which will insure the best prices and no "left over" for the canners, yes, honesty is the best policy.

* * *

No More Birds on Hats—Give a cheer for old Iowa. After the 4th of July the hats of the women of Iowa must be shorn of plumage of birds, other than the game bird. The last legislature provided an act that all wild birds, whether resident or migratory, shall hereafter be the property of the state. It is provided then that "no person shall, within the State of Iowa, kill or catch or have in his or her possession, living or dead, any wild bird other than a game bird, or purchase, offer for sale, transport or ship within or without the state, any such wild bird after it has been killed or caught," except that ordinary cage birds for pets, such as parrots, canaries, etc., are not included in the inhibitions of the act so far as it relates to shipment, sale, etc.

The society women of the Hawkeye State are almost ready to go into hysterics over the law, but the game wardens are sending out notes broadcast, to millionaires, bird plumage furnishing stores, and every one who catches birds for sale that the law will be vigorously enforced after July 4th.

So the plumage of the songsters and the field birds must come off the hats in Iowa. All hail the law! Let it be enforced as sharply as the provocation calls for, to the end that the song birds and the birds of plumage in the state may have their lives preserved. Some controversy having arisen over the question of whether a woman may wear any part of a bird on her hat, under a law passed by the last general assembly, an examination of the statute as passed discloses that it is extremely doubtful if the law will permit the plumage, skin or body of any non-game bird, whether native to this state or not, being worn on the hats of the ladies after July 4th of this year. It would seem that the time intervening before July 4, the ladies may wear plumage and other portions of dead birds on their hats to their hearts' content, but not afterwards.

Iowa has set an example to every state in the Union in this matter, which it will be well to follow from a humanitarian point of view, as well as to save our song birds from annihilation.

Write the Facts East—The State of California will suffer a greater loss in the false impressions given it by the San Francisco disaster, than it will by having all the facts given as they are.

It should be borne in mind that it was not the earthquake that did the greatest damage but the fire which followed. Had it been simply the earthquake the loss in life and property would have been small.

Buildings would have been wrecked, but not destroyed. They could have been repaired at a minimum expense, but when a tornado of fire swept over them, with no water to put them out the finish of the city was only a matter of hours.

Another thing. The water pipes and mains and couplings were old, worn out and bursting throughout the city before the calamity came. They were in no condition to withstand vibrations of the earth no matter how slight. Had water been normal the fires could have been put out and a great part of the city saved. As it was there could be no other alternative except destruction complete and overwhelming.

The best we can do is to write these things east candidly and frankly. Write the truth. Let the facts be known. In all human probability no such vibration will ever again be experienced on this coast.

Certainly nothing of the sort will happen if steel is used in the contsruction of the high buildings as it should be.

San Francisco and the entire coast has received a lesson it should never forget. Its water mains should be tested and its old pipes taken out at least every fifteen years. If this is done they will withstand many times the strain of such an earthquake as the one which broke them two weeks ago. It has been found on examination that the pipes laid down recently are in good condition. The most of them were not bursted, many of them were not bent, but wherever they were old and worn out they gave away. This fact should impress the water companies of all the cities of the Coast to investigate their pipes every few years to see that rust does not render them weak and liable therefore, to break when strain is imposed upon them.

Write another fact back east. The best authorities say, from what they learn by past experience, by the geological formation of the country and by our geographical location Southern California is out of the belt of severe earthquake shocks. We are immune from damaging shocks. We have never had any and we never will have. Be sure to impress this fact upon the minds of your acquaintances. If the truth shall be told California will come out all right. It is the false stories put in circulation by the press and by irresponsible parties sending out lying telegrams, that do the harm.

Write the truth to your friends and write it now.

* * *

Deadly Soda Drinks—For the past five years the leading health journals of the country have been exposing the soda fountain drinks with increasing virulence and persistency. Backed by the authority of chemists and physicians they have made as open war on the soda fountain, as the Womans Christian Temperance Union has on the saloon. But in spite of all this, the soda fountain has prospered and grown and the people have been made sick thereby.

The Cultivator is pleased to learn that the Fruit Exchanges are interesting themselves in exposing the adulterations which are on the market under the name of "fruit extracts." In a recent number of the Times, a writer exposes the "fruit extract" decoction in the following severe manner:

"Soda drinkers would be surprised to know that even in this country of fruits, the fruit extracts are made, in many cases, out of horrible-smelling acids.

Most of the lemon flavor never saw a lemon, and the strawberry flavor is not on speaking terms with a straw berry.

One firm in this city supplies most of the dope flavoring used. They send it out in bottles with a receipt for mixing the concoctions.

On the outside of the bottle of the strawberry flavoring, for instance, is the following directions: For fountain syrup, one to two ounces strawberry extract, one ounce soda foam, one ounce fruit acid solution, strawberry red food coloring to suit.

This is the epitaph on the lemon flavoring; One to two ounces extract of lemon flavoring, one ounce soda foam, two ounces fruit acid solution, light yellow food coloring to suit.

One of the commonest receipts for lemon extract is courmarin and lemon oil colored with aniline. Vanilla extract on the other hand is commonly made of courmarin colored with aniline, or of tonka bean colored.

Most of the so-called "food colorings" are coal-tar products, many of them injurious."

Continuing along this line the writer of the above takes a turn at the "soda pop," "ginger ale" and like drinks, which he avers are doped to the cork. So vile are many of the decoctions used that the Board of Health in many of the larger cities are moving to suppress the selling of these ingredients.

"The "extract" from which the flavoring is to be mixed sells for $1 a bottle, but gallons of flavoring can be made from it. Among other ingredients of the extracts are sulphuric acid and nitric acid.

As a side issue many of these firms turns out adulterated vinegar and claret made of a peculiar combination of chemicals.

It is estimated that $65,000,000 worth was sold in the United States last year, nearly a dollar for each inhabitant.

So important an industry has it become that the Standard Oil Company is said to be dickering for the control of the manufacture of bogus extract. They would be able to use many of the by-products of their petroleum in the coloring extracts.

Although the patent-medicine men have been stormed a with verbal shot and shell, the soda flavoring crimes are but little known. They do not have the additional sin of being directed at sick and helpless folk.

The Cultivator would be glad to extend the information of the poisons which lurk in the soda fountain. The danger to the public is as great as in the cigarette. Both ought to be tabooed out of existence for the good of the human family.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST

HORTICULTURE.

The Tool packing and drying house near Napa was destroyed by fire this week.

T. C. Shaw, residing south of Lodi received last year from his vineyard $500 per acre.

The Ruggles Bros., of Redlands have completed the best equipped packing house in Southern California.

An eminent Japanese bacteriologist demonstrates that the acids of lemons, apples and other fruits—citrus acid and malic acid—are capable of destroying all kinds of disease germs.

There is considerable anxiety manifested by the raisin growers about Fresno over the report that a packing house has offered 3 1-2 cents and it is threatened that a war will be created to prevent canners from closing any additional contracts at this price.

Never in the history of the Anderson and Happy valley sections has there been such a splendid prospect for fruit crops. Prunes and pears and peaches have splendid setting and the yield will be largest known. It will require the services of 900 people to gather the crop.

G. Harold Powell, Government expert in the eradication of fruit decay makes the statement that fruit under ordinary conditions in California, receives too much handling and consequently injuries to the rind cells. This, he states, is the cause of decay during shipment.

The shipment of oranges from South California for the season beginning November 1, up to Thursday night, totals 15,842 cars. For last season it was 19,810 cars, showing a shortage this season of 3,968 cars. And the shortage will continually grow from now on.—Citrograph.

The Board of Horticulture of Santa Ana has decided to begin an active crusade against wild morning glories, Bermuda and Johnson grass, etc., which, it is claimed, are proving to be a pest in that section. It is reported that the purple scale has been eradicated in that county, except for the Anaheim district.

The Hemet News gives out the information that the outlook in that locality is excellent for fruit, that the Gregory Fruit Company has leased the drier and warehouses of the Hemet Fruit Association and that the same company will operate the San Jacinto cannery. Big prices are being offered for apricot, peach, pear and tomato crops.

The Imperial Standard says: All over Imperial valley, wherever grape vines have been planted, they are loaded with young fruit. No sign of mildew anywhere, no appearance of any disease. Warm, dry air and moisture applied to roots as needed and plenty of sunshine evidently form a combination that no grape vine can resist. It just has to grow and bear fruit. In five years' time Imperial valley will be recognized as the greatest grape land in the world.

AGRICULTURE.

10,250 acres of beets have been planted for the Chino Factory for 1906.

The Fullerton Vegetable Union gave 50 crates of cabbages for the San Francisco sufferers.

120 carloads of cabbage were shipped from Fullerton up to Saturday, April 21st. The average price paid was $25 per ton.

J. H. Reed, a capitalist, is thinking of building an alfalfa mill in Sebastopol for the purpose of manufacturing alfalfa meal.

The Alta Advocate says that sugar beets in the neighborhood show signs of rotting. It is thought too much rain is the cause.

Colusa and Glenn counties claim they have raised one per cent. of the entire wheat crop of the United States in a single season.

Water is receeding in the Tulare Lake district and it is estimated now that its presence has been of the greatest value to the farmers of that section.

The railways in Los Angeles, in 1905 received 4,155,407 sacks of potatoes, 22,261 sacks of onions, 54,070 sacks of beans, and 99,336 sacks of sweet potatoes.

According to figures received by Secretary Coburn of the Kansas Board of Agriculture, Kansas farmers expect to raise 70,000,000 bushels of wheat this year.

The Santa Paula Chronicle states that during the past week 8000 sacks of beans were shipped from Saticoy, and the same amount is expected to be shipped this week.

The Institutes held last week at Carpenteria, Fillmore and Monrovia are reported to have been well attended and highly interesting in the nature of the information imparted.

Prof. Northrup of Utah states that comparatively little is known about tomato blight, although it works in such a manner that he is led to believe it is due to bacteria or germs.

The Salinas Index announces that notwithstanding the injury to the Spreckles Sugar Factory, the company will be able to handle the largest acreage of beets in the history of the factory.

It is stated by farmers in the northern part of the State that there is no indication this year of rust affecting the wheat crop, and that the present prospects are that the yield will be greater than in any year since 1884.

The Russian Thistle which the Legislature of Claifornia at its session provided the Horticultural Commissioner should see destroyed is one of the most dangerous of our agricultural pests. The plant grows in the form of the tumble weed, each stalk producing from 20,000 to 30,000 seeds. It should be vigorously cut away before permitted to blossom.

LIVE STOCK.

J. W. Price, proprietor of the Riverside Creamery Company is completing arrangements for establishing a skimming station about a mile from Corona.

The Escondido Times says another big creamery of that town is being extensively improved and when completed will be one of the best in Southern California.

The Davenport Percheron Horse Company of Davenport, Wash., has just purchased from McLaughlin Bros. the three-year-old Percheron stallion, Rosenberg. The price paid was $8000.

During the year 1905, the receipts of produce by railways in Los Angeles was as follows:

Cases of California eggs, 63,608; lbs. of butter, 5,945,468; lbs. of cheese, 2,186,707.

A hog dealer by the name of Hail, living near Chico, who is accused of stealing silverware and crockery belonging to the hotels while gathering up swill for his hogs, was arrested. He should have been arrested likewise for feeding hotel swill to his hogs.

MISCELLANEOUS.

The citizens of Tehama are about to incorporate.

It take 40,000 tons of copper per month to satisfy home and foreign demands.

The assessed valuation of Pasadena will be considerably in excess of $25,000,000 this year.

Andrew Carnegie has pledged $20,000 toward the $100,000 endowment fund now being raised for Whittier College.

Miss Martha N. Hathaway of Claremont has recently presented to Pomona College property valued at $60,000.

Geyersville is making preparations for the floral day celebration to be held there under the auspices of the Grange on May 12th.

The San Diego Electric Railway Company will use a large number of ties imported from Japan for the construction of extensions.

The State Insurance Commission estimates that insurance companies will have to pay losses in San Francisco to the amount of $250,000,000.

Edgar F. Howe has purchased the Imperial Standard. He has been in the past one of the most valuable promoters of the Imperial country.

Governor Pardee is expected to call a session of the Legislature at an early date to provide an appropriation for erecting a State Building in San Francisco.

The Social Improvement Club of Porterville is strenuously advocating the abolition of mosquitoes, and to this end is urging the city trustees to make a vigorous warfare against the pest.

Reports from San Diego county are to the effect that forestry and oiled roads are at present commanding considerable attention and the propects are that great things will be accomplished along these lines in the very near future.

A WELCOME SHIPMENT.

Probably there was nothing more welcome to the San Francisco sufferers after the late earthquake and fire than a car load of oranges from Southern California which found its way among them. No fruit had reached the city for several days; many people had had nothing to eat but a little dry bread; cooking in the city was not allowed and they were hungry when that car load of rich, juicy oranges reached them. I never saw people enjoy anything so much as they seemed to enjoy that fruit, and it gave a zest to the dry food they had been compelled to eat for several days.

FRESH FRUIT SEASON COMMENCED.

Some small shipments of cherries are now being shipped. So far these comprise a few boxes of early fruit being sent by express, but it is the commencement of the fruit season, which will continue now until it ends with grapes in November next. The shipments last year very largely exceeded 8,000 car loads, and it was a somewhat poor season for most fruits. This season, with the exception of apricots, there is every indication that shipments of all kinds of fruit will be heavier. There has been a very large increase in the acreage of table grapes and peaches in the past three years, and very many of the new orchards and vineyards are coming into bearing this year, while the young orchards are increasing their output. The apple acreage also shows a very large increase, these three fruits being the principal ones planted in the past three years. Present prospects are for a fairly good season, and with an increasing demand for our fruits in the East, there is every probability that shipments this year will be heavier than ever before, probably running up to between 9,000 and 10,000 car loads.

Those "succulent esculents" pictured on our cover page are illustrations from the catalogue of the F. Gilman Taylor Seed Co. This firm makes a specialty of the better sorts only of flower and vegetable seeds, and do not carry a "full stock of everything."

The Riverside colony of California has an irrigated area of 13.000 acres. These acres constitute the basis of community life to the extent of 10,000 inhabitants, or one inhabitant for every one and one-third acres.

LINER ADVERTISING

Advertisements in Liner Column will be charged 1¼ cents per word. No advertisement taken for less than 25 cents. Eight words to a line.

LINERS

ANCONA EGGS (FROM PERPETUAL EGG Machines), imported and domestic matings, $2, $3.50 and $5.00. L. L. Viereck, Pres. Ancona Club, Albany, Oregon.

RANCHES WANTED *For Our Clients*
Burr-Paddon Co, 40 Montgomery St., San Francisco

Live Stock and the Dairy

BY MRS. MINNA. E SHERMAN, FRESNO, CAL.

THE DAIRY SIRE.

His importance can not be exaggerated and a dairy man who lives near a town has advantages in keeping a first-class animal to use, wherever there are first-class cows. I often offer the service and three dollars for the calf when twenty-four hours' old, or five dollars straight for use of sire. So many prefer the first that a good-sized herd can soon be built up from superior native or grade cows with the pure blood of the sire.

The bull calf is usually chosen by the purchaser as cheaper to transport and as better in growing up in the surroundings that will make his home. The saving of a little money here is foolish if it can be helped, for every dollars' worth of superiority in the sire is quickly turned back in the heifers. Where $150 is the purchase price, if from the sire are raised only say fifty cows, the blood only cost $3 per head and the improved blood will produce an actual increase in butter to that amount in a month on any of them. When the sire is used for a term of years and a couple of hundred of heifers are in the herd it is soon seen what a gain there is to be counted in his improved blood.
